Original: inglés

Carta de fecha 24 de agosto de 2016 dirigida al Presidente del Consejo de Seguridad por el Secretario General

Tengo el honor de transmitir por la presente el tercer informe del Mecanismo Conjunto de Investigación de la Organización para la Prohibición de las Armas Químicas y las Naciones Unidas.

Le agradecería que tuviera a bien señalar la presente carta y el informe a la atención de los miembros del Consejo de Seguridad.

(Firmado) **BAN** Ki-moon

Carta de fecha 24 de agosto de 2016 dirigida al Secretario General por el Grupo Directivo del Mecanismo Conjunto de Investigación de la Organización para la Prohibición de las Armas Químicas y las Naciones Unidas

El Grupo Directivo del Mecanismo Conjunto de Investigación de la Organización para la Prohibición de las Armas Químicas y las Naciones Unidas tiene el honor de transmitir el tercer informe elaborado por el Mecanismo en cumplimiento de la resolución 2235 (2015) del Consejo de Seguridad.

En el informe se proporciona información actualizada sobre las actividades que ha llevado a cabo el Mecanismo hasta el 19 de agosto de 2016. También se reseñan la evaluación y las conclusiones del Grupo Directivo hasta la fecha, que se basan en el resultado de la investigación de los nueve casos seleccionados de empleo de sustancias químicas como arma en la República Árabe Siria.

Los miembros del Grupo Directivo desean expresar su agradecimiento al Secretario General de las Naciones Unidas por la confianza que ha depositado en ellos. El Grupo aprecia el indispensable apoyo de la Secretaría de las Naciones Unidas, incluidos la Oficina de Asuntos de Desarme, el Departamento de Asuntos Políticos y la Oficina de Asuntos Jurídicos, así como los funcionarios de las Naciones Unidas que han prestado asistencia al Mecanismo en Nueva York, Ginebra y Damasco. El Grupo también agradece el valioso apoyo de la dirección y el personal de la Organización para la Prohibición de las Armas Químicas. El Grupo Directivo desea expresar su reconocimiento al excelente personal del Mecanismo, que, con perseverancia y profesionalidad, ha llevado adelante y ha apoyado la investigación.

El Grupo Directivo agradece a los miembros del Consejo de Seguridad el apoyo que han prestado al Mecanismo. El Grupo expresa también su reconocimiento a los miembros del Consejo y a los demás Estados Miembros de las Naciones Unidas por facilitar información esencial y recursos financieros al Mecanismo en el curso de su investigación. El Grupo reconoce asimismo la labor de todas las demás organizaciones, entidades y personas que han contribuido a la labor del Mecanismo.

El Grupo Directivo desea recalcar que ha llevado a cabo su labor de manera objetiva, independiente, profesional y de conformidad con el mandato de la resolución 2235 (2015) del Consejo de Seguridad. El Grupo Directivo se responsabiliza única y exclusivamente de sus conclusiones.

I. Introducción

1. Este informe se presenta de conformidad con la resolución 2235 (2015) del Consejo de Seguridad, en virtud del cual se estableció el Mecanismo Conjunto de la Organización para la Prohibición de las Armas Químicas (OPAQ) y las Naciones Unidas, cuyo mandato consiste en identificar en la mayor medida posible a las personas, entidades, grupos o gobiernos que hayan empleado sustancias químicas como arma, incluido el cloro o cualquier otra sustancia química tóxica, en la República Árabe Siria o que hayan organizado o patrocinado su empleo o participado en él de cualquier otro modo, cuando la Misión de Determinación de los Hechos de la OPAQ determine o haya determinado que un incidente concreto en la República Árabe Siria haya o pueda haber entrañado el empleo de sustancias químicas como arma.

2. En los dos informes anteriores del Mecanismo (S/2016/142 y S/2016/530), se presentó información sobre sus enfoques metodológicos y actividades de investigación entre el 24 de septiembre de 2015, fecha de inicio del mandato, y el 10 de junio de 2016. Además, el Mecanismo ha informado todos los meses al Consejo de Seguridad sobre sus progresos.

3. En el presente informe se actualiza la información sobre las actividades hasta el 19 de agosto de 2016. También se reseñan las evaluaciones finales que ha realizado el Grupo Directivo hasta la fecha, que se basan en el resultado de la investigación de los nueve casos seleccionados de empleo de sustancias químicas como arma en la República Árabe Siria. El informe contiene diez anexos: uno sobre los métodos de trabajo y uno para cada uno de los casos que se han investigado, a saber:

- a) Kafr Zita (provincia de Hama), 11 de abril de 2014;
- b) Kafr Zita (provincia de Hama), 18 de abril de 2014;
- c) Talmenes (provincia de Idlib), 21 de abril de 2014;
- d) Al-Tamanah (provincia de Idlib), 29 y 30 de abril de 2014;
- e) Al-Tamanah (provincia de Idlib), 25 y 26 de mayo de 2014;
- f) Qmenas (provincia de Idlib), 16 de marzo de 2015;
- g) Sarmin (provincia de Idlib), 16 de marzo de 2015;
- h) Binnish (provincia de Idlib), 24 de marzo de 2015¹;
- i) Marea (provincia de Alepo), 21 de agosto de 2015.

4. En los anexos se describen los incidentes y se enumeran las constataciones, las evaluaciones y las conclusiones del Grupo Directivo al respecto hasta el momento.

¹ La misión de determinación de los hechos indicó que la fecha del incidente fue el 23 de marzo de 2015, pero el Mecanismo ha determinado que los hechos se produjeron el 24 de marzo de 2015 hacia las 19.00 horas.

II. Antecedentes

5. El Mecanismo está dirigido por un Grupo Directivo compuesto la Jefa, Virginia Gamba (Argentina), y dos Jefes Adjuntos, Adrian Neritani (Albania) y Eberhard Schanze (Alemania). Los Jefes Adjuntos se encargan de los componentes político y de investigación, respectivamente, del Mecanismo.

6. El Mecanismo consta de una oficina política con sede en Nueva York que realiza análisis políticos, facilita asesoramiento jurídico, se relaciona con los medios de comunicación y gestiona la información; una oficina de investigación en La Haya que lleva a cabo análisis químicos y médicos, estudios forenses, análisis de munición militar y demás análisis de información pertinente; y una oficina de planificación y apoyo a las operaciones en Nueva York que presta apoyo al Grupo Directivo y a los componentes político y de investigación.

7. El Mecanismo también estableció una oficina de enlace en Damasco, a cargo de un oficial de asuntos políticos, que actúa como principal punto de contacto con el Gobierno de la República Árabe Siria y facilita información actualizada y recomendaciones al Grupo Directivo sobre cuestiones políticas sustantivas.

8. A fin de que el Mecanismo tuviera recursos apropiados y suficientes para la investigación, se contrató a seis especialistas (entre ellos varios traductores) a fin de reforzar el equipo de La Haya con los conocimientos especializados necesarios para llevar a cabo una investigación profesional. El fondo fiduciario que se estableció para atender las necesidades materiales y técnicas del Mecanismo se ha utilizado para este fin.

III. Actividades del Mecanismo

9. En el período inicial de la labor del Mecanismo, del 24 de septiembre al 13 de noviembre de 2015, se establecieron las oficinas tanto en Nueva York como en La Haya. Como se indica en el primer informe del Mecanismo ([S/2016/142](#)), durante ese período se contrató personal con las aptitudes y los conocimientos necesarios; se celebraron reuniones de planificación y consultas con los Estados Miembros; se adoptaron medidas para garantizar la integridad y la confidencialidad de su labor, incluida la protección de documentos, medios de prueba y testigos; comenzó el diseño y la puesta en funcionamiento de un sistema de gestión de registros integrado en un riguroso régimen de seguridad de la información aplicable a todas las informaciones obtenidas o generadas por el Mecanismo; e inició la recaudación de fondos extrapresupuestarios para apoyar sus actividades, así como sus necesidades materiales y técnicas. El 9 de noviembre de 2015, el Secretario General comunicó al Consejo de Seguridad que el Mecanismo empezaría a funcionar a plena capacidad el 13 de noviembre ([S/2015/854](#)).

10. En el período comprendido entre el 13 de noviembre de 2015 y el 29 de febrero de 2016 se desarrolló la primera fase de la investigación, que consistía en recopilar información y planificar la preparación de casos. El 26 de noviembre de 2015, el Mecanismo y la OPAQ concertaron un memorando de entendimiento sobre la facilitación de acceso, el almacenamiento y el tratamiento de la información, incluida la de carácter probatorio, que obtuvieran la misión de determinación de los hechos y el Mecanismo. Sobre la base del memorando de entendimiento, en diciembre el Mecanismo comenzó su labor con el examen y el análisis de la

información y los medios de prueba obtenidos por la misión de determinación de los hechos relativos a los incidentes que la misión ya había investigado y respecto de los cuales consideraba que se habían utilizado, o que era posible que se hubieran empleado, sustancias químicas tóxicas.

11. El 11 de diciembre de 2015, las Naciones Unidas y la República Árabe Siria suscribieron un acuerdo relativo a la situación del Mecanismo a fin de asegurar el cumplimiento rápido y seguro de su mandato en el país. Poco después de la firma, el Grupo Directivo visitó Damasco para examinar con el Gobierno los parámetros de su cooperación en apoyo de la aplicación de la resolución 2235 (2015).

12. Durante la primera fase, el Grupo Directivo definió los métodos de trabajo para el Mecanismo en lo referente a la realización de sus investigaciones, incluida la recopilación de medios de prueba y demás información conexa, así como al análisis, la verificación y la corroboración de la información. El Grupo decidió la metodología que utilizaría para comunicar sus conclusiones al Consejo de Seguridad (véase la sección IV). A partir de una metodología ideada por el Mecanismo, se decidió profundizar en la investigación de nueve casos, con lo que se llegó a la conclusión de la primera fase.

13. La segunda fase dio comienzo el 1 de marzo de 2016, fecha en la que el Mecanismo inició la investigación caso por caso. Se elaboraron planes de investigación específicos para cada caso para contribuir a orientar la investigación general y el propio proceso de planificación. El Mecanismo siguió reuniendo información adicional que no procedía de la misión de determinación de los hechos y entrevistando a los testigos. Se realizaron varias visitas a la República Árabe Siria y a la región para apoyar la investigación. A medida que se recopilaba más información, la investigación avanzó hacia la etapa de análisis, evaluación y corroboración, al tiempo que se iban recibiendo más datos.

14. A lo largo de todo el mandato del Mecanismo, el Grupo directivo siguió tomando las medidas necesarias para solicitar y obtener información pertinente a la investigación de los Estados Miembros, las organizaciones internacionales, las organizaciones no gubernamentales y otras entidades y personas pertinentes.

15. El Grupo Directivo envió solicitudes oficiales de información a 28 Estados Miembros, de los cuales algunos eran miembros del Consejo de Seguridad, países de la región y otros Estados Miembros pertinentes, y visitó 11 de ellos por invitación. Los investigadores también realizaron visitas técnicas. Durante las visitas, como también en sus oficinas de Nueva York y La Haya, el Mecanismo recibió información y exposiciones informativas de carácter técnico pertinentes a la investigación. El Mecanismo examinó y analizó toda la información disponible procedente de la misión de determinación de los hechos, además de la información y el material que había recopilado. En total, fueron más de 8.500 páginas de documentos, transcripciones de más de 200 entrevistas, más de 950 fotografías, más de 450 vídeos obtenidos de fuentes públicas y facilitados por testigos, más de 300 páginas de análisis forenses y más de 3.500 archivos, entre los que había más vídeos, fotografías y grabaciones de sonido. Habida cuenta de que una cantidad significativa de la información reunida por el Mecanismo solo estaba disponible en árabe, fue necesario traducir un gran número de documentos para su examen. Además, los investigadores grabaron numerosas entrevistas con los testigos.

16. El Grupo Directivo recordó continuamente al Gobierno de la República Árabe Siria la necesidad de responder con prontitud a las solicitudes de información del Mecanismo. El Grupo mantuvo una interacción constante con el Gobierno, entre otras cosas mediante visitas a Damasco en diciembre de 2015 y agosto de 2016, más de 20 reuniones bilaterales con el Representante Permanente de la República Árabe Siria ante las Naciones Unidas, y mediante la Oficina de Enlace del Mecanismo en Damasco. Los investigadores del Mecanismo realizaron además cuatro visitas técnicas a Damasco.

17. Desde el 24 de septiembre de 2015, el Grupo ha celebrado más de 150 reuniones bilaterales con los miembros del Consejo de Seguridad y otros Estados Miembros, tanto en Nueva York como en La Haya. Si bien hubo varios Estados Miembros que apoyaron activamente la investigación del Mecanismo aportando información y explicaciones técnicas, el Grupo Directivo lamenta que algunos países de la región no hayan contribuido de manera más sustancial a la investigación.

IV. Consideraciones metodológicas

18. El Grupo Directivo observó que no había precedentes para la investigación destinada a identificar a quienes hubieran empleado sustancias químicas como arma o que hubieran organizado o patrocinado su empleo o participado en él de cualquier otro modo, a diferencia de lo que ocurría con el Mecanismo del Secretario General para la Investigación del Presunto Empleo de Armas Químicas, Biológicas y Toxínicas, para el cual había directrices y procedimientos (véase [A/44/561](#)). Por lo tanto, el Grupo Directivo adoptó métodos de trabajo para el Mecanismo (véase el anexo I).

19. Las declaraciones y conclusiones que contienen los informes de la misión de determinación de los hechos respecto del empleo de sustancias químicas como arma fueron el punto de partida para el Mecanismo en la investigación de los nueve casos. Además, el Mecanismo examinó la información y los medios de prueba de la misión tal cual, es decir, sin discriminarlas con arreglo a la veracidad de sus fuentes o a la metodología o método de trabajo que hubiera adoptado la misión.

20. La labor del Mecanismo estuvo regida por los principios de la imparcialidad, la objetividad y la independencia, y actuó como mecanismo de investigación no judicial. El Mecanismo investigó e intentó identificar a quienes hubieran empleado sustancias químicas como arma o hubieran organizado o patrocinado su empleo o participado en él de cualquier otro modo.

21. La investigación, además de establecer los antecedentes, trató de determinar en cada caso los siguientes elementos clave: a) fecha y hora; b) condiciones meteorológicas; c) lugar del impacto; d) munición (por ejemplo, restos); e) método de lanzamiento (por ejemplo, sistema y dirección); f) daños y efectos (por ejemplo, en los edificios, el medio ambiente, la flora y la fauna); g) efectos clínicos. A fin de determinar los elementos fundamentales, el Mecanismo utilizó planes de investigación y expedientes para los casos, e incluyó la siguiente información: material de la misión de determinación de los hechos (que se examinó y analizó con miras a obtener información pertinente para la investigación del Mecanismo); entrevistas y declaraciones de los testigos (grabadas en archivos de sonido o de vídeo siempre que fue posible, o en transcripciones); documentos como informes,

documentos oficiales, expedientes médicos y material manuscrito (dibujos y listas de nombres); imágenes, incluidas las de satélite, fotografías y vídeos; mapas; infografías y otros datos.

22. Se elaboraron planes de investigación para cada caso a fin de orientar la investigación general. En el curso de la investigación, se prepararon expedientes de cada caso para documentar con detalle la información y los medios de pruebas obtenidos, incluida toda información pertinente obtenida por la misión de determinación de los hechos. Los expedientes del caso conllevaron el análisis de la información y en ellos se documentó el proceso y el grado de corroboración en cuestiones específicas.

23. El Mecanismo procuró corroborar toda la información. Siempre que fue necesario, la información fue objeto de un proceso analítico independiente. En determinados casos, el Mecanismo contó con la colaboración de cuatro institutos forenses y de defensa reconocidos internacionalmente que habían asistido a los órganos de las Naciones Unidas en ocasiones anteriores. Este tipo de análisis, por su naturaleza, es un ejercicio que lleva mucho tiempo.

24. El Grupo Directivo examinó los nueve expedientes y la información y los medios de prueba que figuraban en ellos y que habían preparado sus investigadores. El Grupo ponderó la información y los medios de prueba, teniendo en cuenta su exactitud, credibilidad y fiabilidad, el grado de corroboración y los análisis procedentes de los institutos forenses y de defensa, y sus constataciones, evaluaciones y conclusiones se determinaron por consenso. Para ello, el Grupo se rigió por las normas siguientes (véase [S/2016/142](#)):

- a) Pruebas rotundas (pruebas muy convincentes que respaldan una observación);
- b) Pruebas sólidas (pruebas muy sólidas que respaldan una observación); o
- c) Pruebas suficientes (hay pruebas creíbles y fidedignas gracias a las cuales el Mecanismo está en condiciones de determinar que una parte estuvo implicada en el empleo de sustancias químicas como arma).

25. En los casos en que el Grupo Directivo determinó que no había pruebas suficientes en relación con un incidente investigado por el Mecanismo, lo comunicó debidamente.

V. Valoraciones, constataciones y conclusiones

26. De conformidad con su mandato, el Mecanismo se limitó a investigar únicamente los casos en que la misión de determinación de los hechos hubiera determinado que un incidente concreto en la República Árabe Siria había o podía haber entrañado el empleo de sustancias químicas como arma, incluido el cloro o cualquier otra sustancia química tóxica. La misión había determinado esos casos en relación con los incidentes ocurridos en la República Árabe Siria entre abril de 2014 y septiembre de 2015.

27. La falta de acceso a los lugares que se están investigando debido a la terrible situación de la seguridad sobre el terreno afectó a la forma en que el Mecanismo pudo llevar a cabo la investigación. Las visitas a determinados lugares habrían facilitado la capacidad del Mecanismo para confirmar lugares de interés concretos,

recoger muestras ambientales con fines de comparación, hallar nuevos testigos y efectuar una evaluación física del material de interés para el Mecanismo (por ejemplo, los restos).

28. A pesar de la autoridad que se le otorgaba en virtud de la resolución [2235 \(2015\)](#), en particular en virtud de su párrafo 7, el Mecanismo no podía obligar a que se le presentaran información o documentos. El Mecanismo confiaba, pues, en la presentación voluntaria de información por parte de fuentes que se hallaban en posesión de información de interés. De manera similar, el Mecanismo solo entrevistó a las personas que aceptaron voluntariamente ser entrevistadas sin remuneración alguna. Dado el carácter voluntario del proceso de recopilación de información, ambas partes debieron aceptar condiciones específicas de cooperación que se referían a cuestiones como la confidencialidad, la seguridad nacional y la seguridad de las personas.

29. Además, los siguientes factores afectaron a la investigación: a) la investigación se estaba realizando, en algunos casos, más de dos años después del incidente; b) faltaba una cadena de custodia para parte del material recibido; c) la fuente de información y el material era de carácter secundario o terciario; d) parte del material de información, incluido aquel que describía el tamaño y la naturaleza del incidente, era engañoso; y e) resultó complicado hallar fuentes de información independientes que pudieran brindar acceso a personas y a material informativo.

30. Las constataciones se basan en información recogida y corroborada por el Mecanismo a lo largo de un período de cinco meses y son representativas de la cantidad y la calidad de la información que el Mecanismo recogió en el entorno político altamente delicado que rodea el conflicto que continúa activo en la República Árabe Siria. Las condiciones mencionadas hicieron que la investigación llevara una cantidad de tiempo excepcional y exigieron una enorme labor de fomento de la confianza y encontrar formas de interactuar con diversas fuentes de información.

31. En el presente informe se exponen brevemente las constataciones, valoraciones y conclusiones del Grupo Directivo hasta la fecha.

A. Elementos comunes de los casos investigados

32. El Mecanismo investigó nueve casos, de los cuales ocho estaban relacionados con el empleo de cloro o de un derivado del cloro como arma y otro con el empleo de mostazas de azufre. Durante su investigación y tras haber examinado todo el material recopilado por el Mecanismo, el Grupo Directivo observó los elementos comunes a los ocho casos relacionados con el empleo de cloro que se indican a continuación. Esos elementos deben leerse conjuntamente con las constataciones específicas.

1. Cloro

33. Todas las partes en la República Árabe Siria tienen acceso a cloro. Este se utiliza ampliamente como desinfectante y como compuesto para la depuración del agua. También se utiliza en varias industrias, como la del plástico, la papelera, la de los pesticidas y la industria farmacéutica. El cloro es un material peligroso y la exposición a una dosis elevada puede ser letal. En caso de exposición al cloro, son particularmente vulnerables los niños menores de un año, los enfermos y las personas de edad. El cloro deja escaso o ningún rastro en el cuerpo humano. Dado

su carácter corrosivo y tóxico, para manipularlo con seguridad hacen falta conocimientos y equipo especializado. Por ejemplo, para transferir cloro de un contenedor de 1 t a contenedores más pequeños es necesario un surtidor especial.

34. La eficacia del cloro como arma depende del tipo de munición, los métodos de diseminación, las características del terreno y las condiciones meteorológicas imperantes.

35. En los cinco casos relacionados con el empleo de cloro ocurridos en 2014, los cilindros interiores de la munición presuntamente empleada tenía un diámetro de entre 30 cm y 40 cm y una longitud de entre 155 cm y 175 cm. Ello indicaba que el volumen mínimo estimado de un cilindro era de 125 l. Los cilindros estaban soldados y tenían una válvula central y un seguro excéntrico adicional en la parte superior. Los cilindros no respetaban las normas internacionales de la Organización Internacional de Normalización, que exigen el almacenamiento del cloro en cilindros sin soldaduras con una única válvula. No obstante, las normas nacionales de algunos países permiten emplear esos cilindros soldados (con una válvula y un seguro) para almacenar cloro en forma líquida. El Grupo Directivo observa que esos cilindros se consiguen sin dificultad y se comercializan comúnmente en todo el mundo.

36. En al menos un caso, la información del fabricante aparecía claramente grabada en un cilindro, junto con la indicación “CL₂”, que señalaba la presencia de cloro, lo cual es acorde con la norma industrial. En la mayoría de los otros casos, esos detalles del cilindro interior no se veían.

37. Esos cilindros se pueden llenar y rellenar con líquidos o gas comprimido, pero para ello se requiere equipo apropiado.

38. En lo que respecta a los tres casos relacionados con el empleo de cloro ocurridos en 2015, la información de que dispone el Mecanismo indica que la carcasa exterior de las municiones presuntamente utilizadas contenía varias bombonas de hidroclorofluorocarbonos (HCFC) desechables y botellas de plástico que se cree que contenían permanganato potásico. Las botellas de plástico y el cordón detonante estaban adheridos con cinta adhesiva a las bombonas.

39. Las bombonas de HCFC, comúnmente denominadas bombonas de gas refrigerante, se consiguen con facilidad, pues se utilizan para rellenar los refrigeradores y los aparatos de aire acondicionado. No obstante, estas bombonas son desechables y para reciclarlas o rellenarlas haría falta una modificación técnica de la válvula. Para modificar la válvula a fin de rellenar las bombonas con líquidos o gas comprimido se necesitarían conocimientos técnicos y equipos especiales.

40. La empresa Syrian Saudi Chemicals Company tenía una planta de producción de cloro que producía soda cáustica y cloro líquido 29 km al este de Alepo. El Gobierno afirmó que la planta había sido tomada por el Frente Al-Nusra² en agosto de 2012 y que el Frente Al-Nusra y algunos grupos armados de la oposición tenían capacidad para transportar cloro por todo el país. El Gobierno informó de que, cuando el Frente al-Nusra tomó la planta, en ella había aproximadamente 400 t de cloro. El Mecanismo confirmó que los contenedores de cloro que había en la planta se habían trasladado después de agosto de 2012. No se dispone de información

² El 30 de mayo de 2013, el Frente Al-Nusra fue declarado grupo terrorista por el Consejo de Seguridad de conformidad con la resolución [1267 \(1999\)](#).

sobre a dónde se trasladaron los contenedores ni sobre para qué se podría haber empleado su contenido.

41. El Gobierno también afirmó que en Deir Ezzor había una planta de celulosa que tenía una unidad para la producción de cloro. Según el Gobierno, en esa planta había almacenadas 59 t de ácido clorhídrico y 3 t de hipoclorito de sodio cuando la planta fue tomada por grupos armados de la oposición en el primer trimestre de 2012. Hay información de una fuente abierta que afirma que las características de almacenamiento y las medidas de seguridad de la unidad se mantuvieron después de que la planta fuera tomada, lo cual sugiere que algunos productos químicos permanecieron almacenados en la planta.

2. Aeronaves

42. En la mayor parte de los casos relacionados con el empleo de cloro, el Mecanismo había obtenido información, en particular declaraciones de testigos, sobre la presencia de aeronaves (helicópteros y aviones) alrededor del momento y el lugar en que se produjeron los incidentes que se investigan. Dependiendo del momento del incidente (durante el día o durante la noche), los testigos afirmaron que habían visto o bien que habían escuchado las aeronaves. El Mecanismo solicitó reiteradamente al Gobierno los libros de a bordo, los informes de situación y otros documentos de las Fuerzas Armadas Árabes Sirias. El Gobierno todavía no los ha facilitado.

43. El Gobierno confirmó al Mecanismo que controlaba el espacio aéreo sirio durante los incidentes examinados por este, aunque también afirmó que, en los casos en que los vuelos podrían haber ido por debajo de la zona de cobertura de los radares, no tenía capacidad para confirmar o negar la existencia de otras aeronaves que estuvieran operando en el espacio aéreo sirio. El Gobierno confirmó específicamente que, en el momento en que se produjeron los incidentes investigados por el Mecanismo, controlaba el Aeropuerto Internacional de Alepo, que incluye la base aérea de Nayrab (provincia de Alepo); la base aérea de Hama (provincia de Hama); el Aeropuerto Internacional Bassel al-Assad, que incluye la base aérea de Humaymim (provincia de Latakia); y la base aérea de Abu al-Zuhur (provincia de Idlib). Sin embargo, durante el transcurso de la investigación, el Gobierno perdió el control de seis bases aéreas, entre ellas la base de Taftanaz (provincia de Idlib) y las bases de Minaq, Kuwayris y Jarrah (provincia de Alepo). Específicamente en relación con la base aérea de Taftanaz, el Gobierno informó al Mecanismo de que se habían quedado atrás 15 helicópteros, 9 de los cuales se estimaba que estaban operativos.

44. Cabe señalar que, para funcionar, esas aeronaves exigen un elevado nivel de mantenimiento y conocimientos técnicos, piezas de repuesto y equipos específicos. Además, la capacidad de defensa aérea moderna de las Fuerzas Armadas Árabes Sirias hacía muy difícil que una aeronave pudiera despegar y volar en la zona occidental del país sin ser detectada y destruida. Se solicitó al Gobierno de la República Árabe Siria que proporcionara cualquier información relativa al empleo de esos helicópteros por parte de grupos armados de la oposición, pero hasta la fecha no se ha recibido ninguna información. El Gobierno informó al Mecanismo de que algunos de los grupos armados de la oposición tenían acceso a drones y los habían utilizado. Sin embargo, dado el tamaño de los artefactos que se piensa que se utilizaron en los casos relacionados con el empleo de cloro, los drones de pequeño

tamaño que se afirma que operaban los grupos armados de la oposición no los podrían haber lanzado.

45. Tras examinar toda la información recogida, el Mecanismo no encontró pruebas de que los grupos armados de la oposición hubieran estado operando helicópteros en el momento y el lugar de los casos investigados.

3. Bombas de barril

46. En todos los casos relacionados con el empleo de cloro, se afirma que se utilizaron bombas de barril. Según se afirma, esos artefactos improvisados se configuraron con cilindros interiores o bidones cargados de explosivos o bien de sustancias químicas tóxicas dentro de una carcasa exterior. Dado que se trata de artefactos improvisados, se piensa que su tamaño y su peso varían, pero, basándose en las imágenes de los restos, los expertos han estimado que pesarían entre 350 kg y 400 kg. Debido a su capacidad destructiva, las bombas de barril cargadas de explosivos provocarían grandes cráteres y no quedarían fragmentos grandes de la munición. Por otra parte, cabría esperar que las bombas de barril cargadas de sustancias químicas tóxicas provocarían cráteres de menor tamaño, pues probablemente contendrían una carga explosiva suficiente solo para reventar la carcasa exterior a fin de liberar la sustancia química, con lo cual dejarían restos más grandes. El Mecanismo no logró encontrar ninguna información que sustentara la teoría de que en los casos investigados se habían utilizado métodos de lanzamiento desde tierra, como “cañones del infierno” y “cohetes elefante”, para lanzar esos artefactos. En ninguno de los casos hay imágenes, muestras o partes de la munición que respalden la afirmación de que se habían empleado “cañones del infierno”. Debido a su peso, se cree que las bombas de barril de ese tipo solo pueden lanzarse desde helicópteros.

47. Tras examinar la información y las pruebas de que dispone, el Grupo Directivo considera que las Fuerzas Armadas Aéreas Árabes Sirias emplearon armas improvisadas lanzadas desde helicópteros, incluidas armas en forma de barril. El Gobierno niega poseer bombas de barril. El Grupo señala que sería útil realizar más estudios a fin de contrastar y comparar las diversas municiones empleadas en los nueve casos con los restos de los casos no examinados por el Mecanismo. En lo que respecta a los ocho casos relacionados con el empleo de cloro, en algunos de ellos no se podía descartar la posibilidad de que la munición hubiera impactado contra sustancias químicas tóxicas en el suelo, en particular, debido a que los supuestos restos de los artefactos en los lugares de impacto mostrados habían sido retirados de esos lugares antes de ser documentados (véanse los párrs. 49 a 51).

4. Sistemas de alerta temprana locales

48. El Grupo Directivo tomó nota de que, en la mayoría de los casos, los miembros de la comunidad local habían instaurado un sistema de alerta temprana para emitir alertas cuando se acercaban helicópteros, en algunos casos, refiriéndose específicamente a presuntos ataques con sustancias químicas tóxicas. Ello se hacía en parte mediante la intercepción de las comunicaciones por radio. Se había aconsejado a la población local que se resguardara en los sótanos en caso de ataques aéreos y que escapara hacia posiciones que se encontraran del lado del viento cuando se emitieran alertas de ataques químicos. En algunos casos se comunicó que las alertas de ataques químicos habían provocado el pánico entre la población. En al

menos tres casos, los testigos mencionaron falsas alarmas de ataques químicos, y en dos casos afirmaron que las viviendas habían sido saqueadas después de la evacuación. En algunos de los casos, la descripción del personal de alerta temprana local en relación con un ataque presuntamente lanzado desde un helicóptero era la única constancia que se tenía del método de lanzamiento.

5. Documentación por otras partes

49. El Grupo Directivo observó que gran parte de la información sobre los cráteres y las municiones procedía de los equipos de respuesta inicial y el personal médico o de los grupos de vigilancia con apoyo internacional. Fue difícil encontrar a nuevos testigos que tuvieran información pertinente y específica sobre los casos que no se basara en estas fuentes de información.

50. En la mayoría de los casos, la documentación de los lugares de impacto, incluida la toma de muestras, no se efectuó inmediatamente después de lo ocurrido, sino unos días después. Además, los restos de la munición utilizados habían sido desmantelados y retirados del lugar de impacto antes de documentarse. Así pues, el Mecanismo debía reevaluar el vínculo entre el lugar de impacto y esos restos, algo que no fue posible en algunos casos. El Mecanismo observó que algunos de los lugares de impacto se habían modificado y que no todos los cráteres encajaban con los restos de la munición. En algunos casos parecía que en los presuntos lugares de impacto se habían colocado restos tomados de otro lugar.

51. En los medios sociales se colgaron distintas imágenes grabadas de las explosiones, los lugares de impacto y los restos, que también fueron publicadas o facilitadas al Mecanismo afirmándose que guardaban relación con los incidentes que se estaban investigando. Sin embargo, después de un análisis exhaustivo del material, entre otros por institutos forenses, se llegó a la conclusión de que algunas de las imágenes mostraban lugares diferentes o explosiones de municiones convencionales o de momentos distintos. Como consecuencia de ello, el Mecanismo terminó investigando lugares de impacto y restos adicionales.

B. Conclusiones específicas

52. En cada uno de los nueve casos investigados, hubo que tener en consideración múltiples versiones de los hechos. Además, en los casos relacionados con el uso de cloro, se habían denunciado múltiples lugares de impacto y todos ellos tuvieron que ser investigados. Sin embargo, el Mecanismo constató que en muchos de esos casos solo había información suficiente sobre un lugar de impacto y que en los otros presuntos lugares las pruebas eran muy escasas, es decir que no había información pertinente sobre restos, cráter, impacto y efectos.

53. En los casos de Talmenes (21 de abril de 2014), Sarmin (16 de marzo 2015) y Marea (21 de agosto de 2015), el Grupo Directivo sí dispuso de información suficiente para llegar a una conclusión sobre los agentes involucrados.

Talmenes, provincia de Idlib, 21 de abril de 2014

54. El Grupo Directivo examinó la información existente sobre los dos lugares de impacto en Talmenes el 21 de abril de 2014. El Grupo dispone de información suficiente para llegar a la conclusión de que el incidente en el lugar de impacto

núm. 2 fue causado por un helicóptero de las Fuerzas Armadas Árabes Sirias que dejó caer un artefacto que provocó daños en la estructura de un bloque de viviendas de paredes de hormigón, tras lo cual se liberó una sustancia tóxica que afectó a la población.

55. Esta conclusión se basa en lo siguiente:

- Tanto Ahrar al-Sham como el Frente Al-Nusra tenían una fuerte presencia en los alrededores de Talmenes. De hecho, se había atribuido a ambos el control de la localidad. Talmenes fue objeto de ataques de artillería y de la fuerza aérea el 21 de abril de 2014 y en días cercanos a esa fecha. Ese día se estaba librando una batalla entre fuerzas gubernamentales y grupos armados de la oposición, además del Frente Al-Nusra, en los alrededores de dos bases militares en Wadi Deif y Hamidiyah, ambas en las proximidades de Talmenes.
- Según los testigos, la liberación de productos químicos tóxicos tuvo lugar después de la explosión de una bomba de barril lanzada desde una aeronave.
- Ni el Gobierno ni los grupos armados de la oposición niegan que se haya utilizado cloro en Talmenes el 21 de abril de 2014.
- El Gobierno declaró que el impacto (en el lugar núm. 2) fue causado por un proyectil lanzado desde tierra por un grupo armado de la oposición. Los daños estructurales observados no concuerdan con esa hipótesis.
- El Mecanismo determinó que solo era plausible uno de los dos presuntos lugares de impacto (el lugar núm. 2).
- En el momento en que ocurrió el incidente, el Gobierno había perdido el control de seis bases aéreas, incluida la base aérea de Taftanaz (provincia de Idlib). El Gobierno informó al Mecanismo de que habían quedado 15 helicópteros en la base aérea de Taftanaz, 9 de los cuales se consideraban operacionales.
- El Grupo Directivo examinó toda la información reunida y no encontró pruebas de que los grupos armados de la oposición desplegados en Talmenes operaran un helicóptero en el momento y el lugar del incidente.
- Aunque el número exacto de pacientes no se pudo determinar con exactitud, está claro que hubo un gran número de personas afectadas por sustancias químicas tóxicas.

Sarmin, provincia de Idlib, 16 de marzo de 2015

56. El Grupo Directivo examinó la información existente sobre los dos lugares de impacto en Sarmin el 16 de marzo de 2015. El Grupo Directivo dispone de información suficiente para llegar a la conclusión de que el incidente en el lugar de impacto núm. 2 fue causado por un helicóptero de las Fuerzas Armadas Árabes Sirias que dejó caer un artefacto que alcanzó una vivienda, tras lo cual se liberó una sustancia tóxica, cuyas características concuerdan con las del cloro, que causó la muerte de los seis ocupantes. Los restos del artefacto concuerdan con la construcción de una bomba de barril.

57. Esta conclusión se basa en lo siguiente:

- Los testigos confirmaron que al menos un helicóptero había sobrevolado Sarmin en el momento del incidente.
- Los análisis de expertos y forenses corroboran las declaraciones de los testigos de que un artefacto o una "bomba de barril" que se había lanzado desde un helicóptero cayó en un patio de ventilación de una vivienda (lugar de impacto núm. 2) que estaba habitada en esos momentos por una familia de seis miembros. Los daños concuerdan con los efectos cinéticos derivados de la caída de un artefacto o una bomba de barril desde una gran altura y no con la explosión o detonación de un elemento altamente explosivo.
- Hay múltiples imágenes de vídeo grabadas en el lugar núm. 2 en las que se pueden ver cartuchos de gas HCFC dentro de la casa y una sustancia de color morado en el suelo.
- El Gobierno indicó que no había habido ningún vuelo de las Fuerzas Armadas Árabes Sirias el 16 de marzo de 2015, pero no presentó ninguna información de apoyo. Sin embargo, el Mecanismo pudo obtener información de otras fuentes que corrobora las declaraciones de los testigos respecto de vuelos de helicópteros de las Fuerzas Armadas Árabes Sirias en la fecha y hora del incidente.
- En el momento en que ocurrió el incidente, el Gobierno había perdido el control de seis bases aéreas, incluida la base aérea de Taftanaz (provincia de Idlib). El Gobierno informó al Mecanismo de que habían quedado 15 helicópteros en la base aérea de Taftanaz, 9 de los cuales se consideraban operacionales.
- El Grupo Directivo examinó toda la información reunida y no encontró pruebas de que los grupos armados de la oposición desplegados en Sarmin operaran un helicóptero en el momento y el lugar del incidente.

Marea, provincia de Aleppo, 21 de agosto de 2015

58. El Grupo Directivo examinó la información existente sobre el incidente ocurrido en Marea el 21 de agosto de 2015 y determinó que esa información era suficiente para llegar a la conclusión de que el Estado Islámico en el Iraq y el Levante (EIIL)³ era la única entidad con la capacidad, la motivación y los medios para haber utilizado mostaza de azufre en Marea el 21 de agosto de 2015.

59. Esta conclusión se basa en lo siguiente:

- Marea había sido un bastión tradicional de los grupos armados de la oposición que luchaban contra las fuerzas gubernamentales. El 21 de agosto de 2015, el EIIL avanzó en dirección oeste hacia Marea.
- Según varios testigos y otras fuentes, Marea fue bombardeada con unos 50 proyectiles de artillería, varios de los cuales estaban cargados con mostaza de azufre, que habían sido lanzados desde el este o el sureste, zona que se encontraba bajo el control del EIIL.

³ El 30 de mayo de 2013, el EIIL fue incluido en la lista de grupos terroristas por el Consejo de Seguridad, de conformidad con la resolución 1267 (1999).

- En esa fecha y en los días siguientes varias personas ingresaron en el hospital con síntomas relacionados con la exposición a la mostaza de azufre.
- El Mecanismo recibió y analizó un gran número de fotografías y vídeos de la munición utilizada en Marea. Cuatro fuentes identificaron la munición utilizada como proyectiles de artillería de 130 mm. Las fotografías y vídeos de la munición corroboran la información sobre la liberación de un líquido viscoso y oscuro de los proyectiles de artillería.

60. En los casos de Kafr Zita (18 de abril de 2014), Qmenas (16 de marzo 2015) y Binnish (24 de marzo de 2015), el Grupo Directivo reunió información casi suficiente para llegar a una conclusión sobre los agentes involucrados y recomienda que continúe la investigación de esos tres casos.

Kafr Zita, provincia de Hama, 18 de abril de 2014

61. El Grupo Directivo examinó la información y las pruebas existentes sobre el incidente ocurrido en Kafr Zita el 18 de abril de 2014 y determinó que las Fuerzas Armadas Árabes Sirias habían lanzado ataques aéreos contra la zona ese día. Sin embargo, el Grupo no pudo confirmar el uso de bombas de barril porque los restos del presunto artefacto utilizado habían sido retirados de la zona y no era posible vincularlos con certeza al lugar de impacto núm. 2.

62. El Grupo Directivo determinó que este caso merecía ser sometido a más investigación.

63. Esta evaluación se basa en lo siguiente:

- El 18 de abril de 2014, estaban presentes en Kafr Zita grupos armados de la oposición y el Frente Al-Nusra. Esa zona estaba siendo sometida a fuego de artillería y a ataques lanzados desde el aire por las Fuerzas Armadas Árabes Sirias, algunos de los cuales tuvieron lugar el 18 de abril de 2014.
- El Gobierno ha confirmado que en la fecha y hora del incidente las Fuerzas Armadas Árabes Sirias estaban llevando a cabo un ataque aéreo contra un puesto de observación y habían alcanzado una casa que se estaba utilizando como depósito de artefactos explosivos. Cuando la casa fue alcanzada, se había liberado un gas nocivo de color verde.
- Ni el Gobierno ni los grupos armados de la oposición niegan que se haya utilizado cloro en Kafr Zita el 18 de abril de 2014.
- El Mecanismo solo pudo confirmar un lugar de impacto (el lugar núm. 2). Sin embargo, el Mecanismo no pudo determinar si el cráter había sido causado por una bomba de barril o por otro tipo de munición, como un proyectil de mortero.
- No se encontraron restos de las municiones utilizadas en los presuntos lugares de impacto o sus alrededores porque esos restos se habían retirado de la zona y trasladado a una ubicación distinta. Si bien es cierto que una fuente pública distribuyó varias fotos de restos relacionados con el incidente del 18 de abril de 2014, dicha información adicional no fue suficiente para corroborar el lugar de impacto.

Qmenas, provincia de Idlib, 16 de marzo de 2015

64. El Grupo Directivo examinó la información existente sobre el incidente ocurrido en Qmenas el 16 de marzo de 2015 y determinó que un helicóptero de las Fuerzas Armadas Árabes Sirias había dejado caer un artefacto o una bomba de barril sobre Qmenas.

65. Aunque el Grupo Directivo tenía información casi suficiente para llegar a una conclusión sobre los agentes involucrados, no pudo determinar con certeza, en ese momento, si el artefacto o la bomba de barril que se había utilizado contenía explosivos o cloro.

66. El Grupo Directivo determinó que este caso merecía ser sometido a más investigación.

67. Esta evaluación se basa en lo siguiente:

- Según declaraciones de testigos, un helicóptero dejó caer dos artefactos sobre el borde de una zona militar de Qmenas. Sin embargo, mediante el análisis forense de fotografías e imágenes de satélite, solo se pudo corroborar un lugar de impacto con arreglo a la información proporcionada por tres testigos diferentes.
- Los restos de un artefacto que se encontraron cerca del cráter producido por el impacto son similares a los restos de bombas de barril encontrados cerca de otros lugares de impacto, especialmente en Sarmin. No obstante, tras el análisis de los restos y el cráter, no fue posible determinar si el artefacto contenía explosivos o sustancias químicas tóxicas.
- Se presentaron al Mecanismo versiones alternativas de los hechos, entre otras que se había producido una liberación accidental de gas de un barril que había caído de un vehículo operado por uno de los grupos armados de la oposición o que combatientes de la oposición habían utilizado un "misil fabricado con un cilindro de gas" lleno de sustancias químicas contra otros grupos armados de la oposición. El Mecanismo no pudo obtener ninguna información fidedigna que confirmara esas versiones alternativas.
- El Mecanismo sí obtuvo información de que un helicóptero había sobrevolado Qmenas en la fecha y hora del incidente.
- El Gobierno indicó que no había habido ningún vuelo de las Fuerzas Armadas Árabes Sirias el 16 de marzo de 2015 en esa zona, pero no presentó ninguna información de apoyo. Sin embargo, el Mecanismo pudo obtener información de otras fuentes que corrobora los vuelos de helicópteros en la fecha y hora del incidente.
- En el momento en que ocurrió el incidente, el Gobierno había perdido el control de seis bases aéreas, incluida la base aérea de Taftanaz (provincia de Idlib). El Gobierno informó al Mecanismo de que habían quedado 15 helicópteros en la base aérea de Taftanaz, 9 de los cuales se consideraban operacionales.
- El Grupo Directivo examinó toda la información reunida y no encontró pruebas de que los grupos armados de la oposición desplegados en Qmenas operaran un helicóptero en el momento y el lugar del incidente.

Binnish, provincia de Idlib, 24 de marzo de 2015

68. El Grupo Directivo examinó la información disponible sobre el incidente ocurrido en Binnish el 24 de marzo de 2015 y pudo confirmar la existencia de un cartucho con restos de cloro o una sustancia parecida al cloro. También recibió información adicional sobre los restos de la funda de revestimiento de un artefacto que concuerda con la construcción de una bomba de barril.

69. Sobre la base de la cadena de custodia de los restos encontrados y las conclusiones generales de la misión de determinación de los hechos, el Grupo Directivo tenía información casi suficiente para llegar a una conclusión sobre los agentes involucrados. Sin embargo, sigue habiendo incoherencias en el caso, incluidos los vínculos entre los restos y el lugar (o lugares) de impacto y las descripciones de la explosión y las personas afectadas, que se están investigando.

70. Esta evaluación se basa en lo siguiente:

- Según tres testigos, un helicóptero de las Fuerzas Armadas Árabes Sirias dejó caer por la noche sobre Binnish un artefacto o una "bomba de barril" que contenía sustancias químicas. Sin embargo, hay incoherencias en relación con la fecha y hora del incidente, el lugar (o lugares) de impacto y la descripción de la exposición a sustancias químicas tóxicas sufrida por la población local.
- A pesar de las incoherencias y la escasez de información en torno a este caso, el Mecanismo ha podido corroborar algunos elementos clave, como los restos recuperados por el personal local de respuesta en un terreno agrícola de Binnish, que posteriormente fueron registrados y documentados. Los restos encontrados en el lugar núm. 1, a saber, la funda de revestimiento, un cartucho y una botella de plástico, concuerdan con la construcción de una bomba de barril. El cartucho y el contenido de la botella de plástico se sometieron a pruebas de laboratorio y se encontraron restos de cloro o de una sustancia parecida al cloro en el cartucho. En esas pruebas también se constató que el contenido de la botella de plástico era permanganato potásico. Se pudo determinar la cadena de custodia de esos restos.
- El Mecanismo no pudo obtener ninguna información sobre la explosión del artefacto. No obstante, sí recibió información sobre el lugar de impacto, que se está sometiendo a examen forense.

71. En los casos de Kafr Zita (11 de abril de 2014) y Al-Tamanah (29 y 30 de abril de 2014, y 25 y 26 de mayo de 2014), el Grupo Directivo determinó que la información era contradictoria o insuficiente para poder llegar a una conclusión sobre los agentes involucrados y no recomienda que continúe la investigación de esos tres casos.

Kafr Zita, provincia de Hama, 11 de abril de 2014

72. El Grupo Directivo examinó la información y las pruebas existentes sobre el incidente ocurrido en Kafr Zita el 11 de abril de 2014 y determinó que las Fuerzas Armadas Árabes Sirias habían lanzado un ataque aéreo contra la zona ese día. Se produjo al menos una explosión como consecuencia del ataque aéreo.

73. El Grupo Directivo no pudo confirmar el uso de bombas de barril porque los restos del presunto artefacto utilizado habían sido retirados de la zona y no era posible vincularlos con certeza a ningún lugar de impacto.

74. Si bien un número considerable de personas —hasta 150— podían haber estado expuestas a cloro el 11 de abril de 2014, el Grupo Directivo determinó que no se disponía de suficiente información para llegar a una conclusión sobre los agentes involucrados.

75. Esta evaluación se basa en lo siguiente:

- El 11 de abril de 2014, el Frente Al-Nusra y varios grupos armados de la oposición estaban presentes en Kafr Zita. La zona estaba siendo sometida a fuego de artillería y a ataques aéreos por las Fuerzas Armadas Árabes Sirias. Esos ataques continuaron el 11 de abril de 2014.
- El Gobierno confirmó que, en la fecha y hora del incidente, había lanzado un ataque contra la casa de un comandante del Frente Al-Nusra, que según el Gobierno estaba siendo utilizada para construir artefactos explosivos improvisados y almacenar cloro.
- Tanto el Gobierno como los grupos armados de la oposición coinciden en afirmar que se utilizó cloro en Kafr Zita el 11 de abril de 2014.
- El Mecanismo no pudo confirmar ninguno de los cinco presuntos lugares de impacto.
- En dos vídeos de una fuente pública se puede ver una explosión en Kafr Zita causada por un artefacto lanzado desde una aeronave. Otro vídeo muestra una segunda explosión. No obstante, el Mecanismo no pudo determinar si esa segunda explosión había sido causada por un artefacto lanzado desde una aeronave o por municiones terrestres. Además, esas dos explosiones no se pudieron asociar con ataques que guardaran relación específicamente con el uso de cloro.
- Los restos de las municiones que presuntamente se habían utilizado habían sido retirados de los presuntos lugares de impacto y trasladados a otros lugares.

Al-Tamanah, provincia de Idlib, 29 y 30 de abril de 2014

76. El Grupo Directivo determinó que la información disponible era insuficiente para confirmar o excluir la posibilidad de un ataque químico y que las pruebas eran contradictorias e insuficientes para llegar a una conclusión sobre los agentes involucrados.

77. Esta evaluación se basa en lo siguiente:

- Hay escasez de información pertinente sobre todos los incidentes que tuvieron lugar en Al-Tamanah. El Mecanismo no pudo determinar ningún movimiento aéreo.
- Hay discrepancias en las declaraciones de los testigos y las descripciones de los hechos son incompatibles. Por una parte, algunos testigos describieron a personas que habían sido afectadas por el uso de cloro como arma. Por el contrario, otros testigos describieron los ataques aéreos contra Al-Tamanah que habían tenido lugar a finales de abril de 2014 y afirmaron que en ninguno de ellos se habían utilizado sustancias químicas.
- En opinión de los expertos, este incidente está relacionado con un ataque realizado con municiones convencionales.

Al-Tamanah, provincia de Idlib, 25 y 26 de mayo de 2014

78. El Grupo Directivo examinó la información y las pruebas existentes en relación con el incidente ocurrido en Al-Tamanah los días 25 y 26 de mayo de 2014 y determinó que no había pruebas suficientes para llegar a una conclusión sobre los agentes involucrados ni sobre la modalidad del uso de sustancias químicas como armas en este incidente.

79. Esta evaluación se basa en lo siguiente:

- Hay escasez de información pertinente sobre todos los incidentes que tuvieron lugar en Al-Tamanah. El Mecanismo no pudo determinar ningún movimiento aéreo.
- Según varios testigos, desde abril de 2014 había habido alertas frecuentes a intervalos no uniformes sobre "falsos" ataques químicos, pero nunca se habían utilizado sustancias químicas como armas en Al-Tamanah.
- Otros testigos informaron sobre una "bomba de barril" sin detonar de la que se había fugado cloro. Sin embargo, no había pruebas suficientes para corroborar esos testimonios.

VI. Observaciones finales

80. Inmediatamente después de su creación, el Grupo Directivo observó una disminución del número de denuncias de empleo de sustancias químicas como armas en la República Árabe Siria. Sin embargo, esas denuncias han continuado durante su mandato y, más recientemente, incluyeron una variedad de agentes químicos, algunos de los cuales figuran en la lista de armas químicas con arreglo a la Convención sobre la Prohibición del Desarrollo, la Producción, el Almacenamiento y el Empleo de Armas Químicas y sobre su Destrucción.

81. Las denuncias de uso de armas químicas prohibidas por la Convención o de sustancias químicas tóxicas como armas en la República Árabe Siria que recibió el Mecanismo de los Estados Miembros entre diciembre de 2015 y agosto de 2016 incluyen los siguientes productos: sarín (13), mostaza de azufre (12), agente VX (4), cloro (41) y otras sustancias/agentes químicos tóxicos (61). La información reunida apunta a la participación tanto del Gobierno como de otros agentes en estos presuntos incidentes.

82. El Grupo Directivo reitera su firme convicción de que la utilización de sustancias químicas como armas, cualesquiera que sean las razones y las circunstancias, es totalmente abominable. El Grupo reafirma su convicción de que es absolutamente crucial que los que utilicen o intenten utilizar sustancias químicas como armas rindan cuenta de sus actos.

83. El Grupo Directivo desea expresar su agradecimiento por la plena cooperación recibida de los Estados Miembros, las organizaciones internacionales y otras entidades en apoyo de la labor que ha desarrollado hasta ahora, incluidas las generosas contribuciones financieras aportadas.

84. Por último, el Grupo Directivo desea agradecer el apoyo prestado por la Secretaría, en particular por la Oficina de Asuntos de Desarme, y por la Secretaría Técnica de la OPAQ.

Annex I

Methods of work

1. There were no precedents for the investigation into the identification of the perpetrators, organizers, sponsors or those otherwise involved in the use of chemicals as weapons. This is unlike the case for investigating the alleged use of chemical weapons for which there are guidelines and procedures established for use by the Secretary-General's Mechanism for Investigation of Alleged Use of Chemical and Biological Weapons (see [A/44/561](#)). Consequently, in the absence of a framework to guide its efforts in fulfilling its unprecedented mandate, the Mechanism has been developing operating guidelines and procedures with the aim of identifying those involved in the use of chemicals as weapons in order to ensure that its work adhered to the principles of impartiality, objectivity and independence.

Overview

2. The information obtained by the Organisation for the Prohibition of Chemical Weapons (OPCW) Fact-Finding Mission was reviewed "as is" and the conclusions contained in their reports formed the starting point of the work of the Mechanism. The material collected by the Fact-Finding Mission was reviewed and analysed by the Mechanism with a view to extracting information relevant for the identification of the perpetrators, organizers, sponsors or otherwise involved in the use of toxic chemicals as weapons.

3. The Mechanism's mandate was implemented in two phases: Phase I — information collection and planning for case development, which consisted of reviewing and analysing the Fact-Finding Mission data, mapping of the incidents (i.e., the identification of specific incidents in which the Fact-Finding Mission had carried out an investigation and had determined the use or likely use of chemicals as weapons, screening and prioritization of the incidents (through severity, delivery method and munition, quantity of data and information)) and elaborating an investigation plan and methodology, including evidentiary standards and relevant procedures; Phase II — case investigation, which consisted of in-depth analysis of the cases identified during Phase I and continued until sufficient information was gathered, analysed, assessed and corroborated to allow the Mechanism to present its findings to the Security Council.

Information management

4. The Mechanism took measures to ensure that its personnel complied with the confidentiality and security protections set out in the memorandum of understanding concluded between the Mechanism and the OPCW on 26 November 2015, concerning the provision of access, storage and handling of information. All personnel were also required to enter into individual confidentiality undertakings.

5. In addition, the Mechanism applied the Secretary-General's bulletin on information sensitivity, classification and handling of 12 February 2007 ([ST/SGB/2007/6](#)) in relation to the information collected and produced by the

Mechanism. Furthermore, relevant sections of the Secretary-General's bulletin on record-keeping and the management of United Nations archives of 12 February 2007 ([ST/SGB/2007/5](#)), concerning the creation, management and disposition of records, have been applied by the Mechanism.

6. The Mechanism adopted standard operating procedures and guidelines on information management, as well as the conduct of interviews; collection of evidence and information, including chain of custody forms; and analysis of information.

Collection of information and evidence

7. In addition to information and evidence obtained by the Fact-Finding Mission, the Mechanism gathered information from the following:

- (a) The Government of the Syrian Arab Republic and all parties in the Syrian Arab Republic;
- (b) Other Member States of the United Nations;
- (c) International organizations, international and national non-governmental organizations, other entities and individuals; and
- (d) Open sources.

8. The information and evidence collected by the Mechanism included witness interviews and statements given to other entities (where possible collected as audio and video records or as a transcript); documents including reports, medical records and handwritten material; images including satellite imagery, photographs and videos; infographics and other data. Furthermore, the Mechanism collected forensic analysis, laboratory results and other material such as maps.

Information from the Government of the Syrian Arab Republic

9. At the Mechanism's request, documents and other supporting material such as reports, power point presentations, videos, photos, maps and diagrams were provided by the Government of the Syrian Arab Republic on the nine cases. The Government also facilitated interviews with some of the witnesses. Furthermore, the Mechanism met with representatives of the Government of the Syrian Arab Republic, including members of their armed forces, during its missions to Damascus.

Information from all parties in the Syrian Arab Republic

10. The Mechanism held meetings with armed opposition groups, during which information on the cases under investigation was provided. One group facilitated an interview with one witness. The Mechanism also met with the National Coalition of Syrian Revolution and Opposition Forces. Furthermore, other parties provided documents to the Mechanism.

Information from Member States

11. The Mechanism received case-specific information from 14 Member States. It collected further material to obtain independent confirmation of the information received or used such information to confirm the Mechanism's information or understanding of the cases under investigation.

Information from international organizations, non-governmental organizations, other entities and individuals

12. The Mechanism established a network of contacts in possession of relevant information on the cases under investigation. This included international organizations, non-governmental organizations, the private sector, research organizations, laboratories and institutes, civil society organizations and individuals.

13. This network of contacts provided information and facilitated access to witnesses.

Open sources and social media

14. Extensive material is available on open sources and social media related to the cases under investigation. Such material was mainly in Arabic. The Mechanism reviewed videos and other media files available online allegedly documenting the incidents, including the munition used and the remnants thereof, the delivery method and the impact and effects resulting from the use. Open source and social media material deemed central to the investigation was subjected to forensic analysis.

Compiling of the information

15. Investigation plans were developed for each case to help guide the overall investigation. During the course of the investigation, case files were prepared to document the details of the information and evidence collected, including any relevant information obtained by the Fact-Finding Mission. The case files included the analysis of the information collected and documented the process and amount of corroboration on specific issues. Annexes II to X of the present report are based on the case files prepared during the investigation.

16. In addition to providing the background, the investigation sought to establish for each case the following key elements: (a) date and time; (b) weather conditions; (c) impact location; (d) munition (e.g., remnants); (e) delivery method (e.g., means and direction); (f) damage and effects (e.g., on buildings, environment, flora and fauna); (g) medical effects.

Weather conditions

17. The Mechanism received weather related information for the dates and places under investigation from the World Meteorological Organization (WMO). In providing the information, the WMO stated the following: "The coverage of weather stations across [the Syrian Arab Republic] was very poor during the [periods in question] which makes it extremely difficult to assess weather conditions at the requested locations from observations. One station was close to Kafr Zita [...] so data from that site was used where appropriate. [In addition...]

short range forecasts from a world-leading high resolution global atmospheric model have been used [...] These forecasts are initiated from our best estimate (analysis) of the state of atmosphere [...] Satellite imagery [have also been used] to provide supplementary information, notably for weather descriptions.”

18. Furthermore, the WMO has informed the Mechanism that while the humidity values and temperature data provided are thought to be relatively accurate (within 2° Celsius for temperature), the wind direction/speed are not as accurate as they can be subject to significant variability on time scales of minutes. Nevertheless, the values indicated in the annexes are believed to be reasonable as 60 minute averages. The times of the sunrise and sunset were taken from <http://www.esrl.noaa.gov/gmd/grad/solcalc/sunrise.html>.

Analysis, verification and corroboration of information

Corroboration and analysis

19. The Mechanism aimed to corroborate information. In this connection, identifying circular reporting was important in order to ensure that the corroboration was in fact from separate sources of information.

20. As necessary, information material collected by the Mechanism was subjected to a separate analytical process. On a case-by-case basis, the Mechanism engaged four internationally recognized forensic and defence institutes, which had provided assistance to United Nations bodies in the past. These forensic institutes worked on, among other things, verifying whether videos and photographs had been modified or altered, determining the dates and times of when a video or a photograph was taken and verifying the locations depicted. The defence institutes provided analysis of imagery, munitions-related issues, explosions and modelling of the dispersion of chlorine in the atmosphere. The Mechanism also consulted with a ballistic and explosives expert on the imagery of the points of impact.

Analysis and review

21. As part of the analytical process, an analytical/review team was established to ensure the following: (a) technical adequacy of the information collected; (b) consistency in all the cases under investigation; and (c) identification of patterns emerging from the cases under investigation. During this process, the information received was mapped and entered into a database. Several standard tools such as those used for making projections of information against continuous/discontinuous variables and reconstructive evidence-gathering were used.

Assessment

22. The Leadership Panel carefully reviewed the material submitted by the investigators. They presented the case files, which included the information collected by 10 August 2016. The Panel weighed the information and evidence collected and came to its assessments, findings and conclusions by consensus.

23. The Leadership Panel decided that, in reporting its findings to the Security Council, a sufficient degree of supporting evidence was required; that is, there is

evidence of a credible and reliable nature to determine that a party was involved in the use of chemicals as weapons on the date and time of the incident in which the Fact-Finding Mission determined use or likely use. In so doing, the Panel was guided by the following standards:

- (a) Overwhelming evidence (highly convincing evidence to support a finding);
- (b) Substantial evidence (very solid evidence to support a finding); or
- (c) Sufficient evidence (there is evidence of a credible and reliable nature for the Mechanism to make a finding that a party was involved in the use of chemicals as weapons on the date and time of the incident investigated).

24. Narratives of the incidents and a summary of the information and evidence collected are contained in annexes II to X. In addition, it contains a summary of the findings and concluding assessment.

25. Where the Leadership Panel determined that there was insufficient evidence in relation to an incident investigated by the Mechanism, it has reported accordingly.

Challenges and constraints

26. As was the case with the Fact-Finding missions, the lack of access to the locations under investigation due to the dire security situation on the ground affected the manner in which the Mechanism was able to conduct its investigation. Visits to certain locations would have facilitated the ability of the Mechanism to (a) confirm and access specific locations of interest; (b) collect comparative environmental samples; (c) identify new witnesses; and (d) physically evaluate the material of interest to the Mechanism (e.g., remnants).

27. Other challenges and constraints include the following factors: (a) the time period that had elapsed since the incident (i.e. in some cases, more than two years since the incident); (b) the lack of chain of custody for some of the material received; (c) the source of information and material was of secondary or tertiary nature; (d) some of the information material, including those depicting the size and nature of the incident, were misleading; (e) finding independent sources of information that could provide access to individuals and information material proved difficult; and (f) the impact locations were not preserved and were compromised by the time they were recorded (e.g., the videos and photographs of the impact locations were taken days after the incident and in many cases after the remnants had been removed from the impact location).

Ethical issues and considerations

28. In conducting its investigation and in particular when conducting its interviews, full consideration was given to the privacy and protection of all individuals concerned. All vital information was kept confidential and the identity of witnesses was protected at all times. An identity number, which was assigned to each witness, was used for the processing of data. The master list with the names of the witnesses was kept secure by the Mechanism. Throughout the investigation, the Mechanism made all efforts to respect religious values and norms, national customs and the personal pressures and traumas associated with exposure to conflict.

Annex II

Kafr Zita, 11 April 2014

Findings of the OPCW Fact-Finding Mission in the Syrian Arab Republic

1. The Fact-Finding Mission (FFM) concluded that the information collected constituted “a compelling confirmation that a toxic chemical was used as a weapon, systematically and repeatedly, in the villages of Talm[e]nes, Al-Tamanah, and Kafr Z[i]ta in northern Syria. The descriptions, physical properties, behaviour of the gas, and signs and symptoms resulting from exposure, as well as the response of the patients to the treatment, leads the FFM to conclude, with a high degree of confidence, that chlorine, either pure or in mixture, is the toxic chemical in question.” (S/2015/138, page 24, paragraph 29)
2. “Kafr Zita and its neighbourhood have been subjected to some 17 attacks involving the use of toxic chemicals, with the first attack occurring on the night of 10 April 2014, and the latest incident being reported to the Mission on 30 August 2014. Because of the frequency of these attacks and constantly living in a war zone, the witnesses had essentially lost their sense of the dates and times of the various incidents. Witnesses informed the Mission that all except one of the attacks (which happened between 1800 and 1900 hours on 11 April 2014) occurred at night.” (S/2015/138, page 49, paragraph 5.59)
3. The incident on 11 April 2014 between 1800 and 1900 hours is listed in the FFM as the second attack with toxic chemicals in Kafr Zita, with 12 patients (that includes patients from the first incident on 10 April 2014). (S/2015/138, page 50, Table 6)

The Mechanism’s investigation

Background

4. Kafr Zita (Hama Governorate, Muhradah District) is located 30 km north of Hama, at the administrative border with Idlib District. It is located approximately 8 km west of Morek, which sits at M5 Damascus-Aleppo motorway. Hama city and the Hama Military Airfield are located approximately 30 km south-south-east of Kafr Zita. Muhradah village, at the M56 Damascus-Latakia motorway, as well as the Muhradah dam and hydro-electric power plant located 8 km south.
5. According to a 2004 census, the Kafr Zita sub-district had 39,302 inhabitants. Throughout 2014, high movements of internally displaced persons (IDPs) led to considerably higher numbers of people in the sub-district. A report from the United Nations Office for the Coordination of Humanitarian Affairs indicated that over 61,000 people were considered in need of humanitarian assistance in August 2014, out of which 39,500 were IDPs.
6. The Government of the Syrian Arab Republic stated that it had not been in control of Kafr Zita as of 20 December 2012. The town has since been contested.

Throughout 2014, it saw high intensity of conflict, with frequent air strikes, as well as artillery, mortar and rocket fire reported.

7. In 2014, Government presence in Idlib consisted of networks of checkpoints and military installations: one running along the M5 between Ma'arrat al-Nu'man and Khan Sheikhoun, and the other along the M4 connecting Latakia to Idlib city. At the time, the Government of the Syrian Arab Republic was committed to its obligation to remove its chemical weapon stockpiles to Latakia for maritime removal.

8. From spring 2014 onwards, several armed opposition groups concentrated their efforts in Idlib Governorate on cutting Government access to its military bases and Aleppo via the M5. At the time of the first incident, Morek had recently been captured by armed opposition groups, but was contested between the Syrian Arab Armed Forces (SAAF) and armed opposition group.

9. The Government of the Syrian Arab Republic stated that its troops were located 5 km west of Kafr Zita. Reports indicate that in Muhradah and Al-Suqaylabiyah, National Defense Forces (NDFs) had been established. Most of the immediate neighbouring villages of Kafr Zita have been contested at the time.

10. In spring 2014, armed opposition groups and United Nations Security Council designated terrorist organizations,¹ such as the Nusrah Front, and their affiliates were present in Kafr Zita. Some reports indicate that the city had been partly under control of the Islamic State in Iraq and the Levant (ISIL) until 6 January 2014.

11. Armed opposition groups present included Failaq Al-Sham, an alliance of several groups formed in March 2014, and Jaish Al-Izza, an alliance of several smaller groups most of which were linked to the Free Syrian Army (FSA).

12. At the time, alliances of groups were shifting, smaller groups merged into larger ones and blocks started to emerge. The open fighting between different armed opposition groups and United Nations Security Council designated terrorist organizations that characterized the second half of 2014 had not yet begun and most of the groups concentrated on their fight against the Government of the Syrian Arab Republic. However, armed opposition groups were in competition for fighters, resources and influence and often had quite diverging ideologies. Hence, the situation in Kafr Zita, in which many armed opposition groups were present, was volatile.

13. Ahrar ash-Sham was active throughout Hama and Idlib in 2014, with several reported activities near the vicinity of Kafr Zita in April. However, the group stated not to have been present in Kafr Zita in April 2014.

14. At the time of the events, there were two hospitals in Kafr Zita, referred to as the Western hospital (No. 5) and the Eastern hospital (No. 6). The Eastern hospital, according to the FFM (S/1230/2014, page 25, paragraph 5.56), has been destroyed in an attack later in 2014.

¹ On 30 May 2013, Islamic State in Iraq and the Levant (ISIL) and the Nusrah Front were designated as terrorist groups by the Security Council under resolution 1267 (1999).

Narratives

15. The description as provided by the FFM report indicates that on 11 April 2014 between 1800 and 1900 hours, the public was informed about imminent attacks through messages relayed on hand-held radios. Shortly before sunset, a helicopter dropped a barrel bomb containing a cylinder filled with chlorine on Kafr Zita. A gas cloud rose to some 50-60 m high and then settled towards the ground, moving into the direction of the air current. A strong, pungent and chlorine-like smell was noticeable from a significant distance and disappeared after some 30 to 45 minutes. Several Member States provided information supporting this description. Other entities published reports stating that a helicopter or “plane” dropped a barrel purportedly containing chlorine.

16. The Government of the Syrian Arab Republic stated that on 11 April 2014, the house of a Nusra Front-commander [name redacted], which was used to manufacture explosives and car bombs, was targeted. Upon impact, the house exploded and the odour of chlorine spread through the town, injuring and killing a number of IDPs in Kafr Zita. Six Nusra Front-affiliated fighters from a neighbouring village were in the house and died in the attack. Several barrels of chlorine had been stored in the house.

17. The Government of the Syrian Arab Republic further stated that the Nusra Front then tried to blame the use of chlorine on the SAAF. To this end, they fabricated a video that portrayed false evidence. Another source supported the view that the video had been staged. In particular, the Government of the Syrian Arab Republic and that source claimed that a physician who was a witness to the FFM was involved in the fabrication of evidence.

18. The FFM, based on the testimony of another witness, provides an alternative description of the incidents. When a helicopter flew in the direction of Kafr Zita, armed men fired a so-called “hell-cannon” in the direction of the town. Yellow and white smoke emerged, and the witness smelled a bad odour and experienced difficulty breathing. At the hospital, other patients experienced the same symptoms.

19. The events received broad media coverage. Some indicated that the Government of the Syrian Arab Republic had attacked Kafr Zita with toxic chemicals, others quoted the Syrian Arab Republic state television that the Nusra Front-affiliated fighters had used chlorine in an attack against Kafr Zita.

Date and time

20. The FFM stated that the attack on 11 April 2014 happened between 1800 and 1900 hours, shortly before sunset. The Mechanism reviewed the FFM witness statements that referred to the 11 April 2014 incident. Two witnesses specifically referred to this incident and confirmed the time. This is corroborated with further witness statements. One witness stated that a few minutes after 1800 hours, several barrel bombs were dropped on Kafr Zita.

21. Several sources uploaded videos to the Internet, claiming that these videos show the attack involving “toxic chemicals” in Kafr Zita on 11 April 2014. One of these videos (v01) shows a large explosion shortly before sunset (1903 hours). The end of the evening prayer can be heard. The metadata analysis indicates that this

video has indeed been uploaded on 11 April 2014 at 1923 hours local time. However, the metadata does not contain any indications on when the video has been filmed.

22. A second open source video (v02) published on 11 April 2014 (date not confirmed by forensic analysis) is labelled “Kafr Zita — The moment of the fall of the explosive barrels carrying toxic materials from helicopters”. Although the results of a forensic analysis are pending at the time of this report, there are several strong indications that suggest that the second part of this video seems to show the same explosion as v01. In the first part, it shows a helicopter dropping a device and follows it while falling. However, there appears to be a cut between the view of the falling device and the first image of the explosion. Further forensic analysis to assess how much time passed between the two video segments that appear to have been cut together is pending.

23. A third video (v03) shows a different large explosion during daylight. It is labelled as showing an explosive barrel impacting on Kafr Zita. Metadata analysis indicates that it was uploaded on 11 April 2014, 1739 hours local time. Although, again, it cannot be excluded that the video was uploaded on 11 April but filmed before that, these videos provide an indication that several attacks might have happened in Kafr Zita at that date, as indicated by a witness.

24. One witness stated to have seen a “hell-cannon being” fired at a helicopter in the direction of Kafr Zita in March or April 2014.

25. Another source stated that a spontaneous explosion of a car laden with unidentified explosives resulted in the death of six Nusrah Front-affiliated fighters. The explosion had been accompanied by a strong smell of chlorine in the air and several dozen civilians were poisoned, and some of them killed. The Mechanism could not obtain any information that supports this description.

Weather conditions

26. The sunset on 11 April 2014 was at 1903 hours. At around 1800 and 1900 hours, the temperature declined from 23°C to 19°C with the relative humidity of 72 to 76 per cent. The wind came from the north-west (310°) at 1 m/s to 2 m/s.

Impact location

Location #1

27. A witness stated that a barrel bomb fell on “more than one house” on the west side of the Western (No. 5) hospital. The explosion, which looked “different, the smoke was yellowish orange”, could be seen from the Western Field Hospital. In order to corroborate the impact location, the Mechanism established the location of that hospital, as a reference point, from four different sources.

28. A witness visited the impact location several days after the incident and recorded the visit. In the video (v04), a GPS Application on a tablet shows the coordinates as N35.372950° E36.589800°, which would match the description as provided by the witness.

29. None of the additional witnesses confirmed or provided additional information with regard to this location. The resolution of the satellite imagery available to the Mechanism for this area was too low to identify any signs of the impact. Despite repeated requests, the Mechanism was not provided with any military satellite imagery for the date and location in question.

Location #2

30. Through forensic analysis of v01, a potential impact area of the explosion at sunset was determined. The location given by the two witnesses is further west. Hence, the crater at location #1 shown in v04 does not result from the air strike in v01, although the explosion and resulting cloud, as well as the time, resemble the description of the witness.

Location #3

31. In v03, an impact with several detonations in series on a wide area can be seen and heard. A yellowish cloud emanates from the impact. The forensic analysis indicates that the impact occurred in the south-west region of Kafr Zita.

Location #4

32. The Government of the Syrian Arab Republic provided the coordinates of the house of the Nusrah Front-commander targeted on that date (N35.373189° E36.599503°).

33. However, none of the videos seem to show this attack, as the coordinates are neither located in the potential impact areas as determined by the video analysis, nor do they match the account of the witnesses. Comparison of satellite images of the house before and after 11 April 2014 shows damage, probably resulting from an explosion.

Location #5

34. The witness who spoke about the impact of a hell-cannon described the impact location as “close to the big mosque” and showed it on a map (N35.373642° E36.602564°). Publicly available satellite images on 2 May 2014, few weeks after the attack, show a potential crater approximately 25 m from this location.

35. The impact location does not match any of the other locations. It is 200 m next to the Eastern hospital (No. 6).

Munition

36. The determination of the munition was based on witness statements, videos of the explosion and remnants, in addition to available photos.

Location #1

37. According to a witness, the remnants from location #1, together with remnants from other incidents, were collected and stored outside of Kafr Zita. In a video (v04) that was filmed on 23 April 2014, the location is shown, which includes coordinates on a GPS Application on a tablet (N35.354700° E36.584417°).

Comparing the reference points seen in the video with a map, the GPS coordinates seem credible.

38. V04 and other open source videos show remnants said to be from location #1. Those remnants had been moved from the actual impact location to another location at the outskirts of the village. Several videos and pictures show remnants that are from Kafr Zita, however, it remains unclear to which incident, date and location they are linked.

39. The witness stated that the remnants from location #1 included an outer jacket and an inner cylinder. This description matches the remnants seen in v04. The measurements of the remnants are 160 cm length (157 cm inner cylinder) and 60 cm in diameter (40 cm inner cylinder).

40. One journalist also took pictures at the same location 12 days after the attack and published 59 of them. The same remnants can be seen in the pictures, as in the FFM witness' video, and it is likely to have been taken at the same location.

41. No further witnesses identified by the Mechanism could provide information to confirm that the remnants in the pictures had been removed from the crater at location #1. The munition could not be linked to the impact location and crater through image analysis either.

42. One witness stated that the explosion at location #1 was large and people initially thought it was an attack with a conventional munition. "The smoke was yellowish/orange in addition to the dust caused by the explosion." Another witness stated that the explosion at location #1 was "very big" and that it could be heard from one village to another. This witness described the cloud as being 50-60 m high, spreading quickly because of wind coming from the west.

43. A witness said that when the first barrel was dropped about 400 m from where he/she was, it resulted in a massive explosion with yellowish fumes. The witness also stated that these fumes started moving eastward with the wind and smelled like chlorine.

44. Reports from two independent entities state that a helicopter dropped a big container that fell between four houses. Other than the witnesses above, these reports state that they exploded without making the usual sound of an explosion, releasing unusual yellow-orange smelly gas within a circle of 500 m.

Location #2

45. The descriptions by the witnesses resemble the explosion seen in v01. However, two of them had described the location as location #1.

46. The explosion in v01 shows a yellow base of the explosion. According to a forensic examination, the cloud is resulting from the detonation of an "oxygen-deficient military high explosive type (e.g. TNT)" causing a dark cloud. The yellow colour in the base of the cloud is judged to be dust. According to the Mechanism's and independent weapon experts, the explosions seem to result from "advanced military munition with a primary detonation and delayed sub-detonation".

Location #3

47. In v03, an impact with several detonations in series on a wide area can be seen and heard. A yellowish cloud emanates from the impact. The Mechanism's munitions experts, in coherence with external independent experts and research institutes, concluded the impact probably resulted from conventional military munition, potentially combined with sub-munitions. The title and description of the video does not indicate any links to chemicals.

48. The Mechanism could not exclude that the blast shown on the video originated from ground-based explosives.

Location #4

49. The Government of the Syrian Arab Republic has not provided information on the munition used, although this information was sought on numerous occasions. The Mechanism did not receive any information on footage of or information on remnants from this location.

Location #5

50. The witness stated that the munition was delivered by a device called "hell-cannon". A drawing of the munition made by the witness resembles a possible projectile, also described by various open sources. An LPG or propane gas cylinder is repurposed and filled with explosives and shrapnel. Welded to the payload is a metal tube (the tail) about the same circumference as the cannon's muzzle.

51. The Government of the Syrian Arab Republic, in accordance with reports from independent entities and open sources, provided information on armed opposition groups using hell-cannons to launch IEDs allegedly filled with explosives, often fertilizer. However, the expert's assessment is that the munition as described by the witness is extremely unlikely to have been filled with chlorine.

Delivery method*Location #1*

52. One witness saw a helicopter drop a device on 11 April 2014 around 1800 hours. Another witness stated that "monitors informed that a helicopter was dropping barrel bombs" and that, looking from a window, the witness had seen a "barrel bomb coming down". The report of another organization that documented the events refers to a helicopter taking off from Hama military airport and at 1800 hours targeting the western area of the village.

53. While there are multiple witness statements regarding a helicopter from different sources, the Mechanism has not been able to independently corroborate by a means other than a witness statement that a helicopter was flying in Kafr Zita between 1900 and 2000 hours.

Location #2

54. V01 showing the detonation around sunset was reviewed for the delivery method. An independent research institute and the Mechanism's munition experts

were of the view that “the explosive charges [have been] delivered by dropping from an aircraft”. In the video, an object can be seen falling in a rather vertical angle, just before the detonation, in the direction of the detonation site. In the video, a sound resembling that of a jet fighter can be heard. However, there are many possible explanations for that sound.

55. The Government of the Syrian Arab Republic shared their analysis of v01, stating that it showed an air strike with conventional munition.

56. V02, which seems to show the explosion at location #2 (seen in v01), also shows a helicopter. However, as the video appears to be cut between the images of the helicopter and the explosion, the helicopter cannot be linked to the explosion through this video.

Location #3

57. An independent analysis of v03 indicates that the munitions were delivered by dropping from an aircraft, as indicated in the title of the video. This video is considered not linked to exposure with chlorine.

Location #4

58. The Government of the Syrian Arab Republic, while confirming the attack, did not confirm whether it was undertaken through air strikes or land-based attacks.

Location #5

59. “Hell-cannon” is a name used to describe a class of mortar-like improvised firearms. A number of home-made variants have appeared in the Syrian Arab Republic. When fired, the force of the explosion takes the path of least resistance pushing the projectile towards the target at high velocity. Flight stabilizing fins which are part of the tail ensemble ensure the cylinder does not tumble. It is considered extremely unlikely that the projectile described by the witness would have been launched by hell-cannon.

Unclear location

60. The Mechanism notes that there are two other witnesses interviewed by a different entity who refer to helicopters in Kafr Zita on that day. One of these witnesses was at home at the time of the incident and heard a helicopter hovering at around 1800 hours. A few minutes later the helicopter dropped several barrels specifically on the western part of Kafr Zita. Another witness, who was not in Kafr Zita at the time of the incident, reported that “the nature of the attacks involved air strikes launched by regime warship helicopters that dropped barrel bombs loaded with chlorine which exploded producing yellowish fumes that smelled like chlorine cleanser”. Another entity was quoted by international media referring to a “plane” that dropped a barrel containing chlorine.

61. The Government of the Syrian Arab Republic provided information related to land operations. In response to attacks against SAAF positions, the SAAF used firepower by means of cannons against armed opposition groups in several

locations, including Kafr Zita, resulting in a number of opposition fighters being killed or injured, in addition to vehicles and equipment destroyed.

62. V02, which seems to show the explosion at location #2, also shows a helicopter. However, as the video appears to be cut between the images of the helicopter and the explosion, the helicopter cannot be linked to the explosion through this video.

Damage and effects

Location #1

63. The size of the crater depicted in v04 was approximately 200 cm deep and 400 cm wide. Forensic analysis of the crater was inconclusive with regard to determining its origin.

64. The FFM report refers to a video showing the crater of 3.6 m diameter and 1.4 m depth, with minimal damage to buildings in the vicinity and a screen shot was listed as Appendix 21. However, after thorough analysis, the investigation team concluded that this is a picture of a crater in Talmenes and not Kafr Zita.

Location #4

65. A comparison of satellite images before and after the event on 11 April 2014 showed considerable damage, probably resulting from an explosion.

Medical effects

66. Witnesses and other sources indicated that up to 150 patients were treated in the two hospitals on 11 April 2014. Three people died in the aftermath of the events. One hundred patients were treated in the Eastern hospital and 50 in the Western hospital. Several patients were referred to a neighbouring country for further treatment.

67. According to a witness, one person died from exposure to toxic substances. The other two died from other injuries.

68. External research institute conducted a basic simulation of the dispersion of a chlorine plume in Kafr Zita. The model predicted three deaths in a distance of 50 m from the impact location and 120 affected in a distance of 400 m. The Mechanism used this dispersion model at the potential impact locations in Kafr Zita, to assess the effect on the population.

Location #1

69. On satellite images, 30 houses were located within the plume dispersion area (400 m) at location #1. Based on the assumption that an average of four people was in each house close to sunset, the number of 120 people affected might be possible. For this area, 150 patients stands above the expected number of affected people, in particular if it is considered that one witness referred to the location #1 as an uninhabited area.

70. However, it is also possible that more people might have been in the village or in the area. Also, same as two of the three deadly injured people, according to the

witnesses, did not die of chlorine exposure; some of the patients might have suffered from other injuries and/or anxiety.

71. The Government of the Syrian Arab Republic and one other source accused armed opposition groups and individuals of fabricating false report on patients. They were “filming and taking photographs of the affected population, including children, with a view to presenting the episode as chemical attack by government forces.” A local physician was allegedly directly involved in preparing fake footage paid by other Member States to fabricate these claims. There is no evidence to support the statement given above.

Location #4

72. According to the Government of the Syrian Arab Republic, there were injuries and deaths among IDPs, in addition to six Nusra Front-affiliated fighters. The investigators analysed the effect of the destruction at location #4 considering that toxic chemicals were stored in the building and released with the explosion. Probably the greatest impact would be less than 100 m from the house.

73. It is plausible that people inside the house died and that the neighbouring houses were affected causing exposure to civilians. The investigators estimated that approximately 30 houses would be in this perimeter. A dispersion analysis was not possible due to the lack of information on the kind and amount of toxic substances stored in the house.

Location #5

74. The witness saw yellow and white smoke and smelled a bad odour, as never experienced before. The witness and family members experienced difficulty breathing. In a first interview, the witness mentioned to have seen a three-year-old girl exhibiting laboured breathing, secretions and cyanosis in the hospital. In a second interview, the witness referred only to opposition fighters being treated for other injuries. The Mechanism could not gather additional information to corroborate the witness’ testimony.

The Leadership Panel’s assessment

75. The Leadership Panel examined the existing information and evidence regarding the incident in Kafr Zita on 11 April 2014 and determined that the SAAF executed air strikes in that area on that day. At least one explosion resulted from the airstrike.

76. The Leadership Panel could not confirm the use of barrel bombs because the remnants of the device allegedly used had been removed from the site and could not be linked to any of the impact locations.

77. While a significant number of people — up to 150 — may have been exposed to chlorine on 11 April 2014, the Leadership Panel determined that there was insufficient information at this stage to draw a conclusion on the actors involved.

78. This assessment was based on the following:

- On 11 April 2014, the Nusra Front and several armed opposition groups were present in Kafr Zita. This area was subject to regular artillery and air-borne attacks by the SAAF. Such attacks were ongoing on 11 April 2014.
- The Government of the Syrian Arab Republic confirmed that it had targeted, on the date and time of the incident, the house of a Nusra Front-commander, which the Government alleges was used to build improvised explosive devices and store chlorine.
- Both the Government of the Syrian Arab Republic and armed opposition groups concurred that chlorine was used in Kafr Zita on 11 April 2014.
- None of the five alleged impact locations could be confirmed by the Mechanism.
- Two open source videos show an explosion in Kafr Zita caused by a device dropped from an aircraft. Another video shows a separate explosion. The Mechanism could not, however, determine if the latter explosion was caused by a device dropped from an aircraft, or by ground based munitions. Furthermore, the two explosions could not be associated with chlorine-specific attacks.
- The remnants of the munitions allegedly used had been removed from the alleged impact locations to different locations.

Annex III

Kafr Zita, 18 April 2014

Findings of the OPCW Fact-Finding Mission in the Syrian Arab Republic

1. The Fact-Finding Mission (FFM) concluded that the information collected constituted “a compelling confirmation that a toxic chemical was used as a weapon, systematically and repeatedly, in the villages of Talm[e]nes, Al-Tamanah, and Kafr Z[i]ta in northern Syria. The descriptions, physical properties, behaviour of the gas, and signs and symptoms resulting from exposure, as well as the response of the patients to the treatment, leads the FFM to conclude, with a high degree of confidence, that chlorine, either pure or in mixture, is the toxic chemical in question.” (S/2015/138, page 24, paragraph 29)
2. “Kafr Zita and its neighbourhood have been subjected to some 17 attacks involving the use of toxic chemicals, with the first attack occurring on the night of 10 April 2014, and the latest incident being reported to the Mission on 30 August 2014. Because of the frequency of these attacks and constantly living in a war zone, the witnesses had essentially lost their sense of the dates and times of the various incidents. Witnesses informed the Mission that all except one of the attacks (which happened between 18:00 and 19:00 on 11 April 2014) occurred at night.” (S/2015/138, page 49, paragraph 5.59)
3. The incident on 18 April 2014 around 2230 hours is listed in the FFM as the fifth attack with toxic chemicals in Kafr Zita, with 35 patients. (S/2015/138, page 50, Table 6)

The Mechanism’s investigation

Background

4. Kafr Zita (Hama Governorate, Muhradah District) is located 30 km north of Hama, at the administrative border with Idlib District. It is located approximately 8 km west of Morek and M5 Damascus-Aleppo motorway. Hama city and the Hama Military Airfield are located approximately 30 km south-south-east of Kafr Zita. Muhradah village, at the M56 Damascus-Latakia motorway, as well as the Muhradah dam and hydro-electric power plant, are located 8 km south.
5. According to a 2004 census, the Kafr Zita sub-district had 39,302 inhabitants. Throughout 2014, high movements of internally displaced persons (IDPs) led to considerably higher numbers of people in the sub-district. A report from the United Nations Office for the Coordination of Humanitarian Affairs referred to over 61,000 people as considered in need of humanitarian assistance in August 2014, out of which 39,500 were IDP.
6. The Government of the Syrian Arab Republic stated that it was not in control of Kafr Zita as of 20 December 2012. The town has since been contested. Throughout 2014, it experienced a high intensity of conflict, with frequent air strikes, as well as artillery, mortar and rocket fire reported.

7. From spring 2014 onwards, several armed opposition groups concentrated their efforts in Idlib Governorate on attempts to cut Government access to its military bases and Aleppo via the M5. At the time of the second incident, Morek had just been recaptured by the Syrian Arab Armed Forces (SAAF), but was contested between them and armed opposition groups.

8. The Government of the Syrian Arab Republic stated that its troops were located 5 km west of Kafr Zita. Reports indicate that in Muhradah and Al-Suqaylabiyah, National Defense Forces (NDF) had been established. Most of the immediate neighbouring villages of Kafr Zita have been contested at that time.

9. In the first half of 2014, United Nations Security Council designated terrorist organizations,¹ such as the Nusra Front, and their affiliates were present in Kafr Zita. Some reports indicate that the city had been partly under the control of the Islamic State in Iraq and the Levant (ISIL) until 6 January 2014.

10. Other factions present included Failaq Al-Sham, an alliance of several armed opposition groups formed in March 2014, and Jaish Al-Izza, an alliance of several smaller groups most of which were linked to the Free Syrian Army (FSA).

11. At the time, alliances of groups were shifting, smaller groups merged into larger ones and blocks started to emerge. The open fighting between different armed opposition groups and United Nations Security Council designated terrorist organizations that characterized the second half of 2014 had not yet begun and most of the groups concentrated on their fight against the Government of the Syrian Arab Republic. However, armed opposition groups were in competition for fighters, resources and influence and often had quite diverging ideologies. Hence, the situation in Kafr Zita, in which many groups were present, was volatile.

12. Ahrar ash-Sham was active throughout Hama and Idlib in 2014, with several reported activities near the vicinity of Kafr Zita in April 2014. However, the group stated that it was not present in Kafr Zita around that time.

13. At the time of the events, there were two hospitals in Kafr Zita, referred to as the Western hospital (No. 5) and the Eastern hospital (No. 6).

Narratives

14. The description that emerged from the testimony of witnesses interviewed by the FFM was that on 18 April 2014 around 2230 hours, a helicopter dropped two barrel bombs containing cylinders filled with chlorine.

15. The Government of the Syrian Arab Republic provided a different description of the events on 18 April 2014. The SAAF conducted an air strike against an observation post of the Nusra Front or an affiliated group in the north-eastern part of the town. Fighters had launched an improvised explosive device from there, at the tip of which a gas cylinder had been attached. After the rocket had been fired, it emitted an odour and a thick, white smoke. The group exploited the situation and produced videos, alleging that SAAF had fired shells with chlorine gas. At the same time, the SAAF also targeted the house of a person affiliated with a specific armed

¹ On 30 May 2013, Islamic State in Iraq and the Levant (ISIL) and the Nusra Front were designated as terrorist groups by the Security Council under resolution 1267 (1999).

opposition group that was used as depot for explosive devices. When the house exploded, a noxious, green gas was emitted. The opposition, with the help of a local physician, created false evidence that blamed the chemical attack on the SAAF.

16. A different description provided by another source indicated that the Nusrah Front fighters had used mortar shells filled with chlorine. The Mechanism could not obtain information to support this narrative, including on the impact location, munition and the delivery mechanism used.

Date and time

17. Two witnesses stated that on 18 April 2014 at 2245 hours, two barrel bombs fell on Kafr Zita. Another witness stated that the attack happened around 2300 hours.

Weather conditions

18. The sunset on 18 April 2014 was at 1909 hours. The temperature between 2200 and 2300 hours was 19°C to 20°C. The wind varied at 1 m/s.

Impact location

Location #1

19. A witness indicated that one barrel bomb impacted within a 50 m radius of the Eastern (No. 6) hospital. The Mechanism identified the location of the Eastern (No. 6) hospital as the reference point in two videos retrieved from open sources. The location was confirmed by a witness and the Government of the Syrian Arab Republic.

20. No further information is available on the crater at this impact location and it was not possible to corroborate this information.

Location #2

21. A witness stated that one of the two barrels was dropped on the Kafr Zita football field. The day after the incident, the barrel bomb was still in the crater and removed by an “engineering battalion”. The Mechanism could not identify any new witnesses who could corroborate this information.

22. On 23 April 2014, a witness went to the football field area where the second barrel bomb had reportedly impacted and registered the coordinates at N35.3731667° E036.5973167°. In a satellite image analysis, an anomaly that looks like a crater can be seen.

Location #3

23. The Government of the Syrian Arab Republic provided the location of the farm targeted by the SAAF at N35.3843222° E36.6145250°.

24. Comparison of open source satellite imagery from before and after the event did not show signs of an impact that occurred in this area. An anomaly that looks like a crater was already present in September 2012.

Location #4

25. The Government of the Syrian Arab Republic provided the location of the house which it had also targeted at N35.3721417° E36.6025000° in front of the Big Mosque.

26. Comparison of open source satellite imagery did not show any significant damage after, compared to before 18 April 2014. However, better pictures of a higher resolution would have been required to confirm. The Mechanism has requested high resolution military imagery, but did not receive any.

Munition*Location #1*

27. No information.

Location #2

28. In the footage from the impact location, no remnants can be seen. A witness stated that all remnants had been moved to another location outside of Kafr Zita. That witness provided a video (v01) of the purported remnants filmed at that location. The device consists of an outer jacket of 114 cm in length and 45 cm in diameter and an inner cylinder of the same (114 cm) length and 30 cm in diameter.

29. The title of an open source video (v02) published on 18 April 2014 indicates that it shows an “Engineering Battalion Mohamad” dismantling a barrel bomb filled with chemicals in Kafr Zita at night. According to visual comparison, the remnants resemble those seen in v01.

30. V02 shows an outer barrel with an inner cylinder that appears to have been repainted. A blue detonating cord is wrapped around the opening where the valve had been attached. The valve was removed from the cylinder, but it appears that the cylinder, which had an additional safety plug, did not explode. The rest of the device appears intact. Any gas leakage would, therefore, have been from where the valve was attached.

31. Both the inner cylinder and outer jacket are metallic, which means that it would require at least four metres of detonating cord to breach the walls of both the inner cylinder and the outer jacket. Tape was used to attach the detonation cord to the surface of the inner cylinder.

32. Forensic examination of the video that shows the impact site found that no remnants or remaining fragments can be seen on site, “which suggests the detonation pit is old (>24 hours) when filmed. This fact makes it difficult to assess the size and thereby the cause of the formation of the detonation pit”.

33. Appendix 19 of the FFM report ([S/2014/138](#), page 107, Appendix 19) also shows the sketch of an improvised barrel bomb and a screen grab from a video showing a barrel bomb. The picture and sketch show a larger cylinder and smaller containers. Labels added to the pictures indicate that the smaller containers are filled with sulphuric acid. However, there is no connection between the cylinder valve and the sulphuric acid. Accordingly, it does not appear to be an improvised

explosive. Furthermore, the cylinder is intact and does not match the remnants shown in other footage from the Kafr Zita on the 18 April 2014 case.

34. Several pictures of remnants are published by an open source in relation to the 18 April incident. The Mechanism could not find additional information to corroborate that the remnants were from the incident of 18 April.

Locations #3 and #4

35. The Government of the Syrian Arab Republic has not provided information on the munition used for targeting both locations. The Mechanism could not obtain any other information on the munition used from other sources.

Delivery method

Location #1

36. A witness indicated that one barrel bomb impacted within a 50 m radius of the Eastern hospital (No. 6). No further information could be found.

Location #2

37. Witnesses said that they heard about an approaching helicopter through a radio system. One witness specifically referred to the approach of a helicopter at 2245 hours. The attack occurred at night and none of the witnesses stated that they had seen a helicopter.

38. While there are witness statements regarding a helicopter, the Mechanism has not been able to independently corroborate that a helicopter was flying in Kafr Zita at 2230 hours.

39. A witness took measurements and recorded a video of the crater said to be from 18 April 2014. The crater was 300 cm in diameter and 100-110cm in depth. An external expert stated that this kind of crater could result from a barrel bomb with a cylinder filled with chlorine dropped from a helicopter at high altitude and hitting the ground orthogonally or somewhat obliquely.

40. Another external ballistics expert stated that the large detonation pit diameter, in combination with the shallow depth, suggested the munition had detonated at the surface or directly beneath the surface. The large diameter and geometry of the detonation pit suggest a large calibre mortar round (120 mm or more) may have hit and detonated at the filmed site. However, it cannot be excluded that other possible munitions, like a barrel bomb or another type of bomb dropped from helicopters or aircraft, created this crater.

Location #3

41. The Government of the Syrian Arab Republic had initially stated that an air strike was directed against this position. As mentioned above, the Mechanism could not obtain any footage showing the impact, and satellite image analysis did not yield any results with regard to signs of an air strike.

Location #4

42. The Government of the Syrian Arab Republic did not specify the delivery method for this location. However, the Government provided general information on operations in the area — as a response to attacks against SAAF positions, firepower “by means of canons” was used in several locations, including Kafr Zita. As mentioned above, the Mechanism could not obtain any footage showing the impact, and satellite image analysis did not yield any results with regard to signs of an air strike.

Damage and effects*Location #1*

43. Unknown.

Location #2

44. Soil samples from the impact crater in the football field were taken by a witness and handed over to two Member States. The Mechanism reviewed the results of the analysis, which indicated the presence of chlorinated compounds.

45. The Mechanism requested a ballistics/explosives expert to analyse the crater images and the expert reported that: “The crater arising is somewhat larger than the practical maximal predicted for [a barrel bomb filled with chemicals] ... the inner gas cylinder is quite heavy and pointed it may be expected to penetrate deeper than the predicted value. There may also possibly have been an additional explosive charge in the bomb. If this would be the additional main contributor to the cratering it would be expected to have been of the order of about 2kg of TNT-equivalent. This is judged to be too much if resulting from detonating cord present in the bomb only, but could well be the result of the chlorine gas streaming out violently from the pressure vessel in bomb after it impacted and penetrated into the ground.”

Locations #3 and #4

46. Unknown.

General

47. The distance between the locations indicated by different sources leads the Mechanism to consider the possibility that there were more than two targeted places on this date.

48. There are contradictions, insufficient information and tampering with impact sites. Therefore, the Mechanism could not reach a conclusion on this event.

Medical effects

49. The FFM reports of 35 patients in relation to the incident. No death was recorded. A witness stated that approximately 30 people were affected and went to the hospital. Two other witnesses said that there were around 100 people injured in total. One witness specified that tens of people were suffocating from the impact in the football field and people near the second impact place (close to the Eastern

hospital) were suffering from shortness of breath and suffocation, among them medical staff in that hospital.

50. Too little information was available on topography, obstacles, locations, population density and characteristics (age, gender, health conditions). Therefore, a simulation of the plume dispersion did not yield tangible results.

The Leadership Panel's assessment

51. The Leadership Panel examined the existing information and evidence regarding the incident in Kafr Zita on 18 April 2014 and determined that the SAAF executed air strikes in that area on that day. However, the Leadership Panel could not confirm the use of barrel bombs because the remnants of the device allegedly used had been removed and could not, at this stage, be linked with certainty to impact location #2.

52. The Leadership Panel determined that this case merits further investigation.

53. This assessment was based on the following:

- On 18 April 2014, armed opposition groups and the Nusrah Front, were present in Kafr Zita. This area was subject to regular artillery and air-borne attacks by the SAAF, some of which took place on 18 April 2014.
- The Government of the Syrian Arab Republic has confirmed that on the date and time of the incident, the SAAF conducted an airstrike on an observation post and targeted a house that was used as depot for explosive devices. When the house was struck, a noxious, green gas was emitted.
- Both the Government of the Syrian Arab Republic and armed opposition groups do not deny that chlorine was used in Kafr Zita on 18 April 2014.
- Only one impact site (location #2) has been confirmed by the Mechanism. However, the Mechanism could not determine whether the impact crater was caused by a barrel bomb or a different munition, such as a mortar round.
- The remnants of the munitions allegedly used were not found at or near the alleged impact locations, as they were removed and brought to a different location. While several pictures of remnants are published by an open source in relation to the 18 April incident, the additional information on the remnants has not been to corroborate the impact location.

Annex IV

Talmenes, 21 April 2014

Findings of the OPCW Fact-Finding Mission in the Syrian Arab Republic

1. The Fact-Finding Mission (FFM) concluded that the information collected constituted “a compelling confirmation that a toxic chemical was used as a weapon, systematically and repeatedly, in the villages of Talm[e]nes, Al-Tamanah, and Kafr Z[i]ta in northern Syria. The descriptions, physical properties, behaviour of the gas, and signs and symptoms resulting from exposure, as well as the response of the patients to the treatment, leads the FFM to conclude, with a high degree of confidence, that chlorine, either pure or in mixture, is the toxic chemical in question.” (S/2015/138, page 24, paragraph 29)

2. “Talmenes village was attacked with toxic chemicals on two separate occasions, first on 21 April 2014 and again on 24 April 2014.” (S/2015/138, page 35, paragraph 5.6)

The Mechanism’s Investigation

Background

3. Talmenes (Idlib Governorate, Ma'arrat al-Nu'man District) is located 5 km east of the district capital Ma'arrat al-Nu'man, on one of two highways that connect the district capital with villages to the east, including Abu al-Dhuhur and the nearby Airbase.

4. According to a 2004 census, Ma'arrat al-Numan District had 58,008 inhabitants, 11,359 of which lived in Talmenes. In 2014, according to the FFM report, around 20,000 people were living in the town, which included several thousand internally displaced persons (IDPs) from other places. According to a report of the United Nations Office for the Coordination of Humanitarian Affairs (OCHA), in August 2014 over 65,500 people were in need of humanitarian assistance in the District, including 23,000 IDP.

5. The Nusra Front¹ and Ahrar ash-Sham were reported to have had a heavy presence around Talmenes and involved in frequent clashes with the Syrian Arab Armed Forces (SAAF). Ahrar ash-Sham claimed that they and Firqa 13 controlled Talmenes, while others claimed that the Nusra Front had been in control. Failaq al-Sham had presence in the area, and several other armed opposition groups may also have been present, including Suqour al-Sham.

6. Several sources, including the Government of the Syrian Arab Republic, stated that the Islamic State in Iraq and the Levant (ISIL) had largely retreated from Idlib by March 2014. According to this information, ISIL had not been present in Talmenes at the end of April 2014 and their next position was over 30 km away.

¹ On 30 May 2013, Islamic State in Iraq and the Levant (ISIL) and the Nusra Front were designated as terrorist groups by the Security Council under resolution 1267 (1999).

7. On 5 March 2014, armed opposition groups launched an offensive in the area. The frontline lay to the west of Talmenes, between the village and the SAAF military base at Wadi Deif; armed opposition groups effectively controlled the territory east of the M5 motorway. By 4 April 2014, armed opposition groups had succeeded in cutting off supply lines to the two SAAF bases of Wadi Deif and Al-Hamadiyah for the second time that year, and laid siege to these bases. The Government of the Syrian Arab Republic stated that Wadi Deif had been completely surrounded at the time.

8. In April 2014, there were contradicting witness statements about the situation within Talmenes. Some witnesses indicated that the village experienced daily attacks, while others stated that the village had largely been spared. Media and open sources have very few references to attacks in Talmenes. However, there were many reports of clashes in nearby Ma'arrat al-Nu'man.

9. It is indicated in the FFM report that the Al-Siddiq Hospital in Talmenes had very limited resources and facilities, offering only basic medical aid. The more severe cases were transferred to hospitals in Bab al-Hawa and Saraqeb.

Narratives

10. The FFM report (S/2015/138) stated that on 21 April 2014, between 1030 and 1045 hours, two "barrel bombs" were dropped on the village in the neighbourhood around the "big mosque". They impacted on two residential properties. The people from the neighbourhood sought refuge from the air strike at an olive grove to the east of the village. A honey-wax-to-yellow coloured gas cloud rose from the impact of one of the bombs to a height of some 50-75 m. It was very dense and the smell of the released gas was pungent, irritating and "of chlorine". This cloud settled along with the wind towards the east at a height of some 1-1.5 m above the ground and covered the main escape route to the east. Approximately 200 people were affected and three people died.

11. The Government of the Syrian Arab Republic confirmed that there was an incident in Talmenes on 21 April 2014. According to their description, an armed opposition group fired a projectile from Ma'ar Shamarin (south of Talmenes) that fell in the centre of the village, close to a residential house which is one of the residential properties mentioned in paragraph 10 above. The impact caused substantial damage and two people died. The Government further said that armed opposition group used this incident to accuse the Syrian Arab Army (SAA) to have fired a projectile armed with chlorine gas. This description did not include any information on the use of chlorine gas or affected people. One witness said to have heard the explosion and smelled an odour like "rotten eggs", but did not see any injured people.

12. Another source provided an assessment indicating that an ISIL-firing position for an unguided missile launcher in the area experienced a spontaneous detonation in the course of launching of a live round, releasing an unidentified toxic gas. The explosion allegedly resulted in the death of the missile launcher's operating personnel, the "intoxication" of 83 civilians and the death of livestock. The Mechanism could not obtain any additional information to support this allegation, or even ISIL presence at an operational distance.

Date and time

13. A video (v01), provided by a witness, includes eyewitness statements. One of the individuals in the video stated that an “air strike” took place on Monday, 21 April 2014, at around 1100 hours and both munitions landed within 200 m of the “big mosque”. According to a forensic examination, the metadata indicated that the video was originally captured on 23 April 2014, but also noted that metadata can be altered. The Government of the Syrian Arab Republic confirmed that an incident occurred on 21 April 2014, but did not specify the time.

14. On 25 April 2014, an international newspaper published an article about the attack that occurred in Talmenes on 21 April 2014 based on its own investigations.

Weather conditions

15. On 21 April 2014, between 1000 and 1100 hours, the wind in Talmenes was blowing from west to east (250°-270°) at 3 m/s. The temperature was around 19°C to 21°C, with a relative humidity of 74 to 77 per cent.

Impact location

16. According to a witness, the “air strike” hit approximately 200 m from the big mosque. It is unclear whether this testimony refers specifically to the first or the second impact location.

Location #1

17. Two videos handed over by a witness (v02, v03) show an impact site in a courtyard. In one of the videos, a tablet is shown displaying a GPS application with the coordinates N35.6408333° E36.7426167°, approximately 140 m north-east of the mosque.

Location #2

18. The same videos (v02, v03) also show the impact location at a house. The coordinates displayed on the tablet are N35.6405500° E36.7418833°, which is approximately 75 m north-north-east of the mosque and approximately 75 m south-west-west of location #1.

19. Metadata of the above-mentioned videos do not contain GPS coordinates. Visual comparison of images and satellite pictures carried out by an external forensic institute strongly support that the GPS coordinates displayed in the videos are indeed the sites depicted in it (error 4-8 m). However, they caution, satellite images in higher resolution or other reference images could corroborate the findings, but could also theoretically give a different outcome.

20. The Government of the Syrian Arab Republic provided the name of the owner of the house that had been targeted in the attack by armed opposition groups that they described. The name corresponds to the name of the owner of the house at location #2. The Government had stated that this person had died in the attack; however, this person was interviewed by the FFM several months after the attack.

Munition

21. The FFM report had quoted witnesses, describing the sound of the falling munition as “whistling”. Upon impact, a witness heard a muted, distinct sound, as if there was no explosion or one with very low impact.

Location #1

22. V02 and v03, taken two days after impact, show a crater in a backyard, but no remnants. A person is seen taking measurements of the crater (300 cm in diameter and 100 cm in depth), as referred to in the FFM report ([S/2015/138](#)).

23. A forensic examination of v02 and v03 concluded that: “[The] detonation site [is] questionable in terms of showing an alleged site for a barrel bomb strike with toxic chemicals.” A barrel bomb without a large explosive charge would not penetrate the hard soil to the extent seen. The expert analysis further excludes that a barrel bomb with explosives or other munition has been used, as no traces of shrapnel hits are visible in the surrounding walls and a barrel bomb with corresponding explosive content would cause surrounding walls to collapse. A mortar round, artillery shell or a bomb may have caused a detonation pit of similar size, but there would, most likely, also be traces of shrapnel hits in the surrounding walls and partially or fully collapsed walls due to the damage effect caused by the detonation.

24. According to the forensic expert analysis, the crater (“pit”) in v02 and v03 is caused by a detonation, but the origin of the detonation is probably an explosive charge of 5 to 10 kg TNT-equivalent buried in the ground.

25. A video (v04) by local media shows the same courtyard and crater. There appears to be a cylinder inside containing the deformed remains of the outer jacket of a “barrel bomb”, which is lying next to a crater in the courtyard. Forensic examination and image comparison strongly supported that this video showed the same backyard with a crater (location #1) as v02 and v03. Dead animals are seen next to the crater. Metadata of V04 include timestamps that indicate 20 April 2014 as the creation date, one day before the incident. It is noted, that metadata depends on the settings of the recording device used and can be altered.

26. The analysis of v04 did not change the analysis of the crater above. The forensic report further stated that the remnants seen in v04 are not likely the carrier of the explosives that caused the crater (“pit”), since the device would have fragmented at the top and sides dispersing into smaller pieces, like the remnants in v04. The munition would only have carried a small amount of explosives and could not have caused a crater of this size. In addition, the bodies of the dead animals seen in v04 look clean and intact, making it highly unlikely that they were in the backyard or at close vicinity when the device causing the crater detonated.

27. Another video (v05) provided a witness depicting the same courtyard, but had to be disregarded because it had signs of heavy editing.

28. As a result of these inconsistencies, location #1 was disregarded for further investigation.

Location #2

29. V02 shows the remnants of a barrel bomb that impacted with the outside kitchen structure of a house. The remnants of the outer jacket are deformed. The remains of an inner cylinder, which has been split at the bottom, can be seen lying adjacent to the remnants of the outer jacket. This split is considered to be caused by either a kinetic or explosive force. The measurements of the inner cylinder are approximately 100 cm in length and 40 cm in diameter. The inner cylinder has a main valve at the centre on top and a safety valve, also on top, but offset from the centre. The main valve is broken off. Given that v02 has been taken two days after the incident, it is possible that the remnants may have been moved from the initial point of impact.

30. Samples taken two days after the event at location #2 were provided to an international newspaper. The results of a sample analysis have been published on 29 April 2014, stating that soil samples from Kafr Zita and Talmenes “were found by a chemical warfare expert to contain traces of chlorine and ammonia”. A witness indicated that the samples were analysed by an independent expert, however, the details of the analysis and the chain of custody for these samples have not been established.

31. Another source had collected samples “in Talmenes at the end of April”. This source shared its analysis results, stating that chlorinated compounds, as well as traces of TNT, had been found in the soil and gravel. However, the source cautioned that it had no scientific evidence of the use of chlorine.

32. Another witness mentioned the presence of a likely foreign non-governmental organization which also took samples. The Mechanism did not have direct access to any of the samples.

33. The Government of the Syrian Arab Republic stated that the munition was launched from a land-based delivery system. The munition did not contain chemicals. The Government provided a picture of the type of munition supposedly used at location #2. The munition shown in the photograph has a number of significant differences as compared with the remnants seen in the other pictures and videos related to location #2. That munition is rocket-propelled, with at least eight fins. No remnants of this kind were documented at the site.

Delivery Method

34. Three witnesses stated to have seen a helicopter approaching Talmenes on 21 April 2014, between 1000 and 1100 hours. They said that the helicopter carried munitions on external platforms, which they described as “wings”.

35. In a video (v06) provided by a witness, a person states to have seen an aircraft flying right over the minaret of the mosque. First, it turned east, but then, suddenly, it attacked. This was followed by an explosion which was not very strong.

36. In the same video another person said to have seen an aircraft right over the minaret of the mosque dropping a bomb.

37. Another witness stated to have heard an aircraft at around 1030 hours and saw a helicopter flying over the village. A detonation occurred approximately 30 minutes later and a cloud of yellow smoke emerged, causing panic among the population.

38. Other sources provided their assessment that overflights on 21 April 2014 occurred. There are indications that a helicopter took off from Hama airbase at around 1030 hours, was spotted flying over several villages on the way to Talmenes and allegedly dropped two devices over Talmenes at around 1100 hours.

39. The Government of the Syrian Arab Republic stated that the impact was caused by a land-based projectile launched by an armed opposition group from the vicinity of Ma'ar Shamarin, which is approximately 3 km from the point of impact.

Damage and effects

40. Three witnesses described a 50 to 75-m high yellowish cloud, which was "shaped like a tree". This cloud settled at a height of some 1 to 1.5 m above the ground, over 200 m towards the east in the direction of the wind. People were affected as far as 1 to 1.5 km downwind.

41. According to the FFM report, all witnesses described the smell as pungent, irritating and "of chlorine", or similar to household cleaning agents, but much more intense.

Location #2

42. The videos from this impact location (v02) show a lot of destruction and damage to the structure of the house. The munition is understood to have impacted a concrete block building and resulted in extensive damage to the structure. Large quantities of rubble and other building debris are visible. As a result, there is not a clear view of the crater; however, a crater-like structure is visible. The video shows yellowing leaves on the trees and dead leaves on the ground.

43. The forensic analysis of the destruction at location #2 indicates that it is possible that the structural damage to the building could have been caused by the detonation of a barrel bomb. The large size of the remnants, they argue, would indicate that either the device contained explosives that did not detonate, or that it only contained a small amount of explosives.

44. The rocket-propelled munition type indicated by the Government of the Syrian Arab Republic is, according to munition experts, almost certainly a conventional high-explosive type. Such an amount of explosives, estimated to be at least 200 kg, would have totally destroyed the house at location #2 and possibly a number of surrounding buildings. The damage seen in the available pictures and footage at location #2 is inconsistent with this assessment.

45. One witness referred to animals that had died when the barrel bomb hit at location #2. Another witness reported that the pepper plants in the garden turned yellow and half of them dried out.

Medical effects

46. A witness stated that 200 people had been affected by the use of chemicals, many of whom were transferred to other hospitals. Another witness produced a list of 133 patients registered at Talmenes Hospital on 21 April 2014, based on the information of another witness, and also provided four photographs of severely affected patients. The number of injured people in Talmenes was confirmed by one other source. Another witness confirmed that 150 patients from Talmenes had been received at Jarjanaz Hospital that day.

47. V06 concludes with chaotic scenes in what appears to be Talmenes Hospital. It includes interviews with people who were identified as hospital staff. One of them stated that the number of casualties from 21 April 2014 went up to 400, although the timeframe is unclear.

48. V06 also includes testimonies of those who lived in the two houses that were impacted (locations #1 and #2). Family members reported suffering from choking and heavy coughing, unconsciousness and vomiting blood. One mother described her skin irritation from touching her affected daughter. A young boy had blood and foam coming from the mouth.

49. Three persons are reported to have died after referral to other hospitals in a neighbouring country. The “death certificate” of one of the victims at location #2, issued on 25 April 2014, has been obtained by the Mechanism. This document, however, does not include the cause of death. The autopsy report does not provide the cause of death either.

50. People used the usual escape route in case of air strikes, eastward into a low-lying olive ground. The wind was blowing from west to east with 3 m/s; according to the data from the World Meteorological Organization (WMO), the direction of the dispersion of the plume is credible. Two external sources provided their results of a chlorine dispersion plume analysis, stating that it was feasible that a chlorine barrel bomb could have affected 200 people, most of them mildly.

51. The Government of the Syrian Arab Republic indicated that the main impact of the explosion was the destruction of a structure at location #2, which killed the owner (name provided) and his child. However, a witness interviewed by the FFM later identified himself as this person (i.e., the owner of the house and father of the child that died in the attack).

52. The launch of a projectile from the ground would not explain the 200 to 300 victims suffering from chlorine exposure. The Government of the Syrian Arab Republic stated that it believed the number of victims was incorrect. According to a witness, armed opposition fighters spread the information about the use of chemicals after the explosion, causing panic among the population. The same people also provided face masks to people and told them to leave the village. Despite a smell of “rotten eggs”, the witness did not feel any symptoms and did not see any injured people; just those in panic. The witness attempted to enter the hospital, but was denied access. The same witness stated that people who were referred to other hospitals came back to town two days later, with no visible signs of injuries.

53. The description of the effect on the population — who were evacuated from the town after an air strike and caught up in a toxic plume — is consistent with a

plume dispersion analysis carried out by two Member States and the weather information received by WMO. While the exact number of patients could not be definitively established, it is obvious that large numbers of people were affected by toxic chemicals. Several sources shared their analysis of soil samples, which indicated the presence of chlorinated compounds.

54. The structural damage at location #2 could result from the detonation of a barrel bomb, but not from a conventional high-explosive type munition. The remnants documented at the location resemble those of barrel bombs, with remnants of an inner cylinder and an outer jacket. No remnants of a rocket-propelled munition were documented at the site. Witness statements provide a clear link between an explosion, the smell of chlorine, a cloud and the effect on the population.

55. Witnesses and other sources provided information indicating that helicopter(s) were present; and some said that the helicopters delivered the munition. Only one witness seems to have actually seen a device falling. The testimony of other witnesses and persons interviewed in videos that were provided to the Mechanism differ in their description of the time lapse between observing the “aircraft” and the explosion.

The Leadership Panel’s assessment

56. The Leadership Panel examined the existing information regarding the two impact locations in Talmenes on 21 April 2014. There is sufficient information for the Leadership Panel to conclude that the incident at impact location #2 was caused by a SAAF helicopter dropping a device causing damage to the structure of a concrete block building house and was followed by the release of a toxic substance which affected the population.

57. This conclusion was based on the following:

- Ahrar ash-Sham and the Nusrah Front had heavy presence around Talmenes. Both were said to have been in control of the town. Talmenes was subject to regular artillery and air force attacks around and on 21 April 2014. On that day there was an ongoing battle between Government forces and armed opposition groups, as well as the Nusrah Front around the two military bases at Wadi Deif and Al-Hamidiyah, both of which are in close proximity of Talmenes.
- Witnesses stated that the release of toxic chemicals followed the explosion of a barrel bomb dropped from an aircraft.
- Both the Government of Syrian Arab Republic and the armed opposition groups do not deny that chlorine was used in Talmenes on 21 April 2014.
- The Government of the Syrian Arab Republic stated that the impact (location #2) was caused by a land-based projectile launched by an armed opposition group. The structural damage was not found to be consistent with this.
- Only one of the alleged impact sites (location #2) has been found plausible by the Mechanism.
- At the time when the incident occurred, the Government of the Syrian Arab Republic had lost control of six airbases, including Taftanaz airbase (Idlib

Governorate). The Government informed the Mechanism that 15 helicopters were left behind of at Taftanaz airbase, nine of which were deemed operational.

- The Leadership Panel reviewed all the information gathered and found no evidence that armed opposition groups in Talmenes was operating a helicopter at the time and location of the incident.
- While the exact number of patients could not be definitively established, it is obvious that large numbers of people were affected by toxic chemicals.

Annex V

Al-Tamanah, 29-30 April 2014

Findings of the OPCW Fact-Finding Mission in the Syrian Arab Republic

1. The OPCW Fact-Finding Mission (FFM) concluded that the information collected constituted “a compelling confirmation that a toxic chemical was used as a weapon, systematically and repeatedly, in the villages of Talm[e]nes, Al-Tamanah, and Kafr Z[i]ta in northern Syria. The descriptions, physical properties, behaviour of the gas, and signs and symptoms resulting from exposure, as well as the response of the patients to the treatment, leads the FFM to conclude, with a high degree of confidence, that chlorine, either pure or in mixture, is the toxic chemical in question”. (S/2015/138, page 24, paragraph 29)
2. “The dates recounted are 12, 18, and 30 April 2014, and 22 and 25 May 2014. All attacks, except the one of 22 May 2014, occurred at night. These attacks resulted in more than 150 casualties, and eight of the most severely affected, mostly women and children, died from exposure to lethal doses of the toxic chemical.” (S/2015/138, page 20, paragraph 10)
3. Among the five dates the witnesses recalled was an incident in the night from 29 to 30 April, resulting in 35 casualties. (S/2015/138, Table 4 on page 43)

The Mechanism’s Investigation

Background

4. Al-Tamanah (Idlib Governorate, Ma’arrat al-Nu’mān District) is located less than 9 km east of the M5 Damascus-Aleppo motorway, on the section between the cities of Hama and Idlib. The FFM reported that, in 2014, approximately 20,000 inhabitants lived in the vicinity of Al-Tamanah, as compared to 7,385 in town and 29,144 in the sub-district in the 2004 census. This included 5,000 to 10,000 internally displaced persons (IDPs). According to a report from the United Nations Office for the Coordination of Humanitarian Affairs (OCHA), in August 2014, 5,500 IDPs were in need of humanitarian assistance in the Al-Tamanah sub-district.
5. At the time of the incidents, Al-Tamanah found itself in immediate proximity to the front line. While several armed opposition groups operated from the vicinity of Al-Tamanah, the Government of the Syrian Arab Republic held checkpoints and bases along the M5 motorway and Khan Shaykhun in the west of Al-Tamanah.
6. The first half of 2014 in Idlib saw clashes between the Government of the Syrian Arab Republic and armed opposition groups around the M5. The armed opposition groups were aiming at — and partly succeeding in — opening their access to Idlib city and cutting Government supply to their military bases. Morek (approximately 10 km to the south-south-west of Al-Tamanah) had been captured by armed opposition group in February 2014, since then been contested and reportedly recaptured by Government forces on 14 April 2014.

7. In March and April 2014, armed opposition group operations concentrated on capturing checkpoints along the M5 between Morek, Khan Shaykhun and Ma'arrat al-Nu'man. It seems that different armed opposition groups were at that time joining forces and divided "responsibility" of checkpoints among them. The Government of the Syrian Arab Republic sought to maintain M5 access, while also establishing alternative routes to Aleppo and Idlib city.

8. In spring 2014, Al-Tamanah was used as a "collective operational base" by several armed opposition groups. United Nations Security Council designated terrorist organizations,¹ such as the Nusrah Front, and those affiliated with them were also present. Witnesses also referred to the presence of the Islamic State in Iraq and the Levant (ISIL) in Al-Tamanah; however, following clashes with the Nusrah Front and armed opposition groups, ISIL had largely retreated from Idlib in March 2014.

9. Several other armed opposition groups had presence and operations in the area, however, the period was characterized by a high volatility of conflict dynamics, armed opposition group locations and alliances, as well as spheres of influence.

10. One of the more influential armed opposition groups was reportedly the Idlib Military Council, which formed part of the Jabhat Thuwar Suriyya since December 2013. There are contradicting statements regarding the presence of other armed opposition groups at the time of the incidents. While some sources report that Jaish Al-Izza, an alliance of several groups formed in 2014, was temporarily headquartered in Al-Tamanah, other sources did not confirm this. Witnesses indicated that Ahrar ash-Sham had presence there as well, but its representatives did not confirm this.

11. Two health facilities in Al-Tamanah have been mentioned by witnesses in relation to the incidents under investigation: The Hanin Medical Charity/Point and the 9th Medical Point. In open sources and media reports about patients suffering from exposure to chlorine, the Hanin Medical Point and a medical field facility can be seen. Hanin Medical Point is funded by donations, without the consent of the Government of the Syrian Arab Republic. Due to the limited capacities, severely injured people are often referred to other hospitals.

Narrative

12. There are different descriptions of the events in Al-Tamanah. The description emerging from the testimony of FFM witnesses is that in the night between 29 and 30 April 2014, an alert was issued by a flight monitoring observatory of helicopters approaching and potentially bringing chlorine bombs. Two barrel bombs were dropped and 35 patients sought medical attention with symptoms related to chlorine exposure at that day. According to the witnesses, Al-Tamanah was attacked five times with barrel bombs possibly containing chlorine dropped from helicopters in April and May 2014.

¹ On 30 May 2013, Islamic State in Iraq and the Levant (ISIL) and the Nusrah Front were designated as terrorist groups by the Security Council under resolution 1267 (1999).

13. The Government of the Syrian Arab Republic denies any military activity of its Forces in Al-Tamanah on that date and provided information to show that the events had been fabricated. In accordance with this, seven witnesses stated that frequent alerts had been issued, but in fact no incidents with chemicals took place. While people sought safety after the warnings, their homes were looted and rumours spread that the events were being staged.

14. Based on witness statements, the Mechanism assessed the possibility that a conventional air strike or attack took place and the chemical exposure was wrongly attributed to this. However, no air activity could be established. The witness testimonies of air strikes did not specify a date and the description as such could not be linked to the incident of 29-30 April 2014. Hence, this possibility was disregarded.

15. Several witnesses gave testimony of repeated air strikes around or on the dates of the incidents in Al-Tamanah. Information and statistics available to and analysed by the Mechanism did not contain specific data on air strikes in the town, to establish a more accurate picture of the conflict dynamics in the immediate vicinity at the time. The Government of the Syrian Arab Republic stated that no military activities were conducted from land or air in Al-Tamanah on the dates of the incidents, but did not provide any records of flight operations to support this statement.

Date and time

16. Most of the witnesses were interviewed several months after the alleged incidents. Due to the frequency of alerts and incidents related to military activity, the witnesses' memory of the events might have blurred. Most of them did not give specific dates, but referred to several incidents in a timeframe between March and June 2014.

17. Only one witness specifically referred to the incident on 29-30 April 2014, but did not provide a specific time. The same witness said that four people died in this incident and did not mention a second impact location.

18. Three witnesses, who did not give any description of the incident on 29-30 April 2014, provided material of unknown source. One witness had second-hand knowledge of two of the five incidents in Al-Tamanah, but did not remember the exact dates. Later that witness provided a USB-stick with information of unknown origin, which was saved in separate folders according to the dates of all the five incidents mentioned by the FFM. Another witness provided the dates of all five incidents reading it from a piece of paper, but did not provide any testimony on the incident on 29-30 April 2014. The latter also provided a video titled "site where second barrel containing toxic chlorine gas was dropped tamanaa 30 April 14".

19. Several media reports quoted "local activists" saying that one or several helicopters dropped "two bombs laden with gas" or "explosive devices containing chlorine" on the town of Al-Tamanah in the early hours of the morning of 30 April 2014. Several open source videos show patients being treated in what appears to be Hanin Medical Point and a field medical facility.

20. Several witnesses stated that chemical weapons alerts through media or the local early warning systems occurred frequently at non-regular intervals since April or May 2014. Although the majority of witnesses referred to the chemical weapons alerts, issued by a “flight observatory”, the exact dates of the warnings remained unclear.

21. Seven witnesses stated that after several alerts, no attack actually occurred, and that they had come forward to contest the wide-spread false media reports. The alerts, they said, were false alarms and toxic chemicals had never been used in Al-Tamanah. It remained unclear how they could make such exclusive statements for the whole town at any time. Some of these witnesses stated that after the false chemical alerts, the houses of those who evacuated had been looted.

22. When interviewed a second time, two of those witnesses described air strikes in Al-Tamanah in or at the end of April 2014, which they had not mentioned before, but said that chemicals were not involved in any of the attacks. Although no specific dates have been given, the Mechanism investigated the possibility that these statements refer to the incident on 29-30 April 2014, but could not find any links to support that.

Weather conditions

23. In the night from 29 to 30 April 2014, between 2000 and 0100 hours, the wind came from the west (260-300°) and the wind speed declined from 4 m/s to 2 m/s over that period. For the rest of the night, the wind speed from various directions declined from 4 m/s to 2 m/s. From 2000 to 0600 hours, the temperature dropped gradually from 18°C to 13°C and the relative humidity increased from 82 per cent at 2000 hours to 93 per cent at 0600 hours.

Impact locations

Location #1

24. The Mechanism endeavoured to establish the location of the impact at a residential house in the north of Al-Tamanah. The exact location was not given and could not be determined from the descriptions and reference points given by the witnesses. No public satellite imagery was available for the time and location in question. Despite repeated requests, no military satellite imagery was made available to the Mechanism either.

25. All footage provided by witnesses was showing the interior of the Hanin Medical Point, but not the surrounding area. Two videos (open source) show an impact location between houses that appear uninhabited. The videos do not show enough of the surroundings to establish the exact impact location.

Location #2

26. Another video (available on open sources), which has been provided to the Mechanism by several different sources, shows remnants on an open field. An additional video provided by a witness shows an impact location on an open field with something that looks like remnants of munition. The impact location is next to an unpaved road. Houses that look uninhabited can be seen in the vicinity, some of

which are damaged. The video does not show enough of the surroundings to establish of the exact impact location.

Munition

Location #1

27. The Mechanism did not obtain any parts, samples or imagery (photos or videos) of the munition or its remnants at location #1. Some remnant fragments can be observed in the videos mentioned previously, but not enough to allow for sufficient analysis.

28. The witness described the impact of a barrel and subsequent explosion, as observed from a roof, as follows: “A flame or fire or something yellow went 20-25 m up in the air and disappeared immediately.” This is understood to refer to the location #1. The witness did not mention a second impact and stated that four people had died in this attack, although no deaths have been established by the FFM for this incident. The witness did not have a mask and, therefore, was unable to go to the impact location. The witness neither mentioned the smell of chlorine nor was aware of a chemical alert.

Location #2

29. The Mechanism did not obtain any parts or samples of the munition or its remnants at location #2. The remnants in the video of location #2 could be interpreted as remnants of a barrel bomb. However, only parts of the outer jacket can be seen, not allowing for a definite analysis either. In the absence of sufficient footage or any description of the remnants, the Mechanism endeavoured to draw conclusions on the munition from the description of the impact.

30. The Government of the Syrian Arab Republic provided information that on 30 April 2014 a device left by an armed opposition group exploded on an agricultural road west of Al-Tamanah, which led to the death of one citizen. The Mechanism investigated potential links to location #2, but could not find any further information to support this.

Delivery method

31. Despite repeated requests, none of the Mechanism’s sources provided information regarding air movements on the night from 29 to 30 April 2014; neither affirmative nor negative. Only the Government of the Syrian Arab Republic provided information and stated that they did not have any military activities from land or air in Al-Tamanah at this date. Witness statements about air strikes around the time could not be linked to the specific night from 29 to 30 April 2014.

Location #1

32. The eyewitness, who stated to have been on the roof, said to have heard a helicopter and the “very loud” sound of a falling barrel. Some interviewees had referred to a distinct whistling sound of barrels that contain chlorine as they fall. The witness statement could not be corroborated with any further information.

Location #2

33. No witness statements or other information was available to either confirm the claim that a second barrel bomb was dropped from a helicopter, or that an improvised explosive device (IED) exploded.

Damage and effects*Location #1*

34. According to the eyewitness, the building was almost entirely destroyed, with only two walls remaining standing. The surrounding area was also affected. The two videos mentioned above also show a high level of destruction.

35. The Government of the Syrian Arab Republic has put forward their analysis of these two videos, concluding that the destruction was a result of a conventional munition rather than a chemical munition.

36. The Mechanism requested a forensic examination from an independent institute. The findings were inconclusive. A shallow “hole” can be seen; it might have been the result of a conventional barrel bomb with explosives, but an impact from a chemical barrel bomb could not be excluded.

37. Additional open source videos are allegedly related to the incident on 29-30 April 2014. Two of those videos were considered showing location #1. Parts of a destroyed house can be seen, together with a crater and something that might be remnants of munition. However, it could not be determined whether these munition parts are linked to the impact, or not. The videos do not show enough of the surrounding areas to determine potential environmental impact.

38. The description of the impact by the witness, in addition to the destruction seen in the videos, does rather point to the use of conventional munition (air or land) than to the use of a barrel bomb filled with chlorine, which would have a small explosive charge. The information available, however, is not enough for a thorough analysis.

Location #2

39. The videos do not show a crater or other signs of the impact of the remnants.

Medical effects

40. The FFM describes the medical symptoms of patients for all of the five incidents in summary. For the 29-30 April 2014 incident, the FFM reported 35 patients. A witness who provided the dates, number of patients and deaths for each of the five incidents, read it from a piece of paper.

41. The eyewitness of the explosion related to location #1 stated that four people died and 70 were injured in this incident, while the FFM report had established only 35 patients and no deaths. Some media reports also referred to 70 people affected by the use of chlorine as a weapon.

42. An independent source provided a list of unknown origin with 12 names of people injured with chlorine gas on 29 April 2014. No medical records have been

received from the Hanin Medical Point, despite repeated requests. The Mechanism requested medical documentation from referral hospitals, but did not receive any information relevant to the date and incident in question.

43. Videos retrieved from open sources and from a witness, respectively, show patients being treated in Hanin Medical Point and in a medical field facility. However, the analysis of these videos did not provide any additional and verifiable information on the alleged impact site or delivery methods. For that reason, no further forensic analysis has been undertaken.

44. Some of the witnesses stated that “nothing happened” in Al-Tamanah and did not see any patients that suffered from chemical exposure. However, these witnesses are not considered to be in a position to make definitive statements for the whole town.

45. Without knowing the impact location and how densely the impact area was populated, in addition to the fact that many people had left the village when a chemical weapons alert was issued, insufficient data was available to apply chlorine dispersion models.

Further information

46. The incident received broad media coverage. Some international media reported that the Government of the Syrian Arab Republic had used barrel bombs with toxic chemicals.

47. Several witnesses reported that local responders (sometimes specified as the “white helmets”) established basic early warning systems through local media, volunteers, hand-held radios and mosques. After the first chemical attacks, they provided information about the recommended behaviour in case of air strikes and chemical attacks. In case of chemicals alerts, people were encouraged to move upwind of the point of impact to higher elevations, while in case of conventional attacks people were advised to seek shelter in basements.

48. Six witnesses stated that people left the village and that during the evacuation after what they said were false alarms, their own or neighbours’ houses were looted. Some referred to people with “masks”, potentially gas masks, who were giving face masks soaked in “Coca-Cola” or “Pepsi” to children. Two witnesses referred to rumours in town of people trying to “blame” the Government or stage the incidents.

49. A witness described an air strike on the house of an armed opposition group fighter “at the end of April”. The next day, people wearing masks were “digging something out of the ground” and filming the scene, saying that Al-Tamanah was hit with toxic chlorine gas. However, the witness did not smell gas or see any injured people. When interviewed before, the same witness had not mentioned this incident.

50. Some of the witnesses said that armed men, some of them from Al-Tamanah and some foreigners from other countries, were issuing false chemical alarms saying that the Government of the Syrian Arab Republic military would attack the village with chemicals, sometimes saying chlorine, and telling people to leave the village. These alerts were issued in different ways, from vehicles with microphones, mosques or just telling people in person. Two witnesses mention the same person who was allegedly filming the “staged” scenarios.

51. One witness said that people were knocking on the door. People on motorcycles and cars told people to leave the house because a plane was going to attack. Children of different ages were running after them. Apparently the people, which the witness believes to belong to the Nusra Front, went to the school, took the children out and gave them diapers soaked with a liquid in order to use them as gas masks, claiming that chlorine would be used in the air strike. The witness stayed at home despite the warning and did not smell or see anything.

The Leadership Panel's assessment

52. The Leadership Panel determined that there is insufficient information to confirm, or to exclude the possibility of a chemical attack. It further determined that there was contradictory and insufficient evidence to draw a conclusion on the actors involved.

53. This assessment was based on the following:

- There is scarcity of relevant information about the incidents in Al-Tamanah. No flight movements could be established by the Mechanism.
- There are discrepancies in the statements made by different witnesses and the descriptions of the event are inconsistent. On the one hand, some witnesses described people affected by the use of chlorine as a weapon. On the other hand, other witnesses described air strikes in Al-Tamanah in or at the end of April 2014 and stated that chemicals were not involved in any of the attacks.
- This incident has been considered by experts to stem from an attack with conventional munition.

Annex VI

Al-Tamanah, 25-26 May 2014

Findings of the OPCW Fact-Finding Mission in the Syrian Arab Republic

1. The Fact-Finding Mission (FFM) concluded that the information collected constituted “a compelling confirmation that a toxic chemical was used as a weapon, systematically and repeatedly, in the villages of Talm[e]nes, Al-Tamanah, and Kafr Z[i]ta in northern Syria. The descriptions, physical properties, behaviour of the gas, and signs and symptoms resulting from exposure, as well as the response of the patients to the treatment, leads the FFM to conclude, with a high degree of confidence, that chlorine, either pure or in mixture, is the toxic chemical in question”. (S/2015/138, page 24, paragraph 29)
2. “The dates recounted are 12, 18 and 30 April 2014, and 22 and 25 May 2014. All attacks, except the one of 22 May 2014, occurred at night.” (S/2015/138, page 20, paragraph 10)
3. Among the five dates that the witnesses recalled was an incident in the night from 25 to 26 May 2014, without casualties. (S/2015/138, Table 4 on page 43)

The Mechanism’s investigation

Background

4. Al-Tamanah (Idlib Governorate, Ma'arrat al-Nu'man District) is located less than 9 km east of the M5 Damascus-Aleppo motorway, on the section between the cities of Hama and Idlib. The FFM reported that in 2014 approximately 20,000 inhabitants lived in Al-Tamanah, as compared to 7,385 in town and 29,144 in the sub-district in the 2004 census. This included 5,000 to 10,000 internally displaced persons (IDPs). According to a report from the United Nations Office for the Coordination of Humanitarian Affairs (OCHA), in August 2014, 5,500 IDPs were in need of humanitarian assistance in the Al-Tamanah sub-district.
5. At the time of the incidents, Al-Tamanah found itself in immediate proximity to the front line. While several armed opposition groups operated from the vicinity of Al-Tamanah, the Government of the Syrian Arab Republic held checkpoints and bases along the M5 motorway and Khan Shaykhun in the west of Al-Tamanah.
6. The first half of 2014 in Idlib saw clashes between the Government of the Syrian Arab Republic and armed opposition groups around the M5. The armed opposition groups were aiming at — and partly succeeding in — opening their access to Idlib city and cutting Government supply to their military bases. Morek (approximately 10 km to the south-south-west of Al-Tamanah) had been captured by armed opposition groups in February 2014, since been contested and reportedly recaptured by Government forces on 14 April 2014.
7. In March and April 2014, armed opposition groups’ operations concentrated on capturing checkpoints along the M5 between Morek, Khan Shaykhun and Ma'arrat

al-Nu'man. It seems that different groups were at that time joining forces and divided “responsibility” of checkpoints among them. The Government of the Syrian Arab Republic sought to maintain M5 access while also establishing alternative routes to Aleppo and Idlib city.

8. Several witnesses gave testimony of repeated air strikes around or on the dates of the incidents in Al-Tamanah. Information and statistics available to and analysed by the Mechanism did not contain specific data on air strikes in the town to establish a more accurate picture of the conflict dynamics in the immediate vicinity at that time. The Government of the Syrian Arab Republic stated that it did not conduct any military activities from land or air in Al-Tamanah on the dates of the incidents.

9. In the first half of 2014, Al-Tamanah was reportedly being used as a “collective operational base” by several armed opposition groups. Witnesses also referred to the presence of the Islamic State in Iraq and the Levant (ISIL)¹ in Al-Tamanah; however, following clashes with the Nusrah Front and armed opposition groups, ISIL had largely retreated from Idlib in March 2014.

10. Several armed opposition groups had presence and operations in the area, however, due to the high volatility of conflict dynamics, their locations and alliances (in addition to contradicting reports, most of which do not have the level of detail required), the exact locations and spheres of influence at the date and locations investigated cannot be established with certainty.

11. One of the more influential armed opposition groups was reportedly the Idlib Military Council, which formed part of the Jabhat Thuwar Suriyya since December 2013. There are contradicting statements regarding the presence of other armed opposition groups at the time of the incidents. While some sources report that Jaish Al-Izza, an alliance of several groups formed in 2014, was temporarily headquartered in Al-Tamanah, other sources did not confirm this. Witnesses indicated that Ahrar ash-Sham had presence there too, but its representatives did not confirm this.

12. Two health facilities in Al-Tamanah have been mentioned by witnesses in relation to the incidents under investigation — the Hanin Medical Charity/Point and the 9th Medical Point. In open sources and media reports about patients suffering from exposure to chlorine, the Hanin Medical Point and a medical facility in a tent can be seen. Hanin Medical Point is funded by donations, without consent of the Government of the Syrian Arab Republic. Due to the limited capacities, severely injured people are often referred to other hospitals.

Narratives

13. The description that emerged from the testimony of FFM witnesses was that on the night between 25 and 26 May 2014, two barrel bombs were dropped over Al-Tamanah. One of it failed to explode (location #1), but the impact opened a cylinder inside the barrel which leaked chlorine. The unexploded barrel was found

¹ On 30 May 2013, Islamic State in Iraq and the Levant (ISIL) and the Nusrah Front were designated as terrorist groups by the Security Council under resolution 1267 (1999).

in the morning. The other barrel bomb exploded (location #2), but nobody was affected as it fell in an uninhabited area of the village.

14. Similarly to the incident on 29-30 April 2014, the Government of the Syrian Arab Republic denies any military activity of its forces in Al-Tamanah on 25 and 26 May and provided information to show that the events had been fabricated. Accordingly, other witnesses stated that frequent alerts had been issued but in fact no incidents with chemicals took place, and while people sought safety after the warnings, their homes were looted. Witnesses stated that they heard rumours that the events were being staged.

Date and time

15. Most of the witnesses did not give specific dates, but referred to several incidents between March and July 2014. Only one witness specifically recalled the date of 25-26 May 2014. The same witness stated to have helped dismantle the munition the following day and noticed a strong smell of chlorine. That witness also provided five videos of the excavation of the munition, in addition to five pictures of the remnants in a courtyard.

16. Another witness gave the summary of an event that resembled the description of the first witness and likely refers to the same incident, without recalling the exact date, and said that the event occurred around 2300 hours. The interviewee was among a group of people who found the unexploded munition the following morning.

17. A third witness described second-hand knowledge about an incident in which one barrel bomb failed to explode but leaked gas.

18. One witness had second-hand knowledge of two of the five incidents in Al-Tamanah. The witness did not remember the exact dates, but later provided a USB-stick with information, which was saved in separate folders according to the dates of all the five incidents mentioned by the FFM. The folder “25-5-2014 صور البرميل” contained four pictures and a video of the munition in a courtyard. This witness did not refer to this incident during the interview.

19. Another witness provided the dates of all five incidents, reading it from a piece of paper, but did not provide any testimony related to the incident on 25-26 May 2014.

20. Seven witnesses from Al-Tamanah said that since April 2014, “false” chemical weapons alerts occurred frequently in non-regular intervals. Several of them stated that no chemical weapons had ever been used in Al-Tamanah.

Weather conditions

21. On the night from 25 to 26 May 2014, between 2000 and 0500 hours, the wind came from the west (280°) at a speed from 3 m/s to 2 m/s (3 m/s at 2000 hours). The temperature dropped gradually from 22°C to 15°C and the relative humidity increased from 79 per cent at 2000 hours to 89 per cent at 0500 hours.

Impact location

22. The witness who gave a testimony resembling the events on 25 and 26 May without recalling the date drew a map of the impact location. However, due to the lack of detail and reference points on that map, it did not help to determine the impact location. Another witness drew a map of four impact locations in Al-Tamanah and numbered them 1, 2, 3 and 5, but it is unclear which impact location from the drawing correlates to which incident.

Location #1

23. The exact impact location of the barrel that failed to explode could not be determined from the witness statements or footage provided. Four videos showed this impact location (v01-v04). All four videos are filmed in close-ups and the surroundings cannot be seen. These videos were not forensically examined.

24. A witness stated that an unexploded barrel fell on a house and mentioned the name of the owner. The exact location of the house could not be determined. No public satellite imagery of the timeframe in question was available to find a potential crater or impact. No military satellite imagery has been made available to the Mechanism despite repeated requests.

Location #2

25. The witness who helped to evacuate the unexploded munition and recalled the exact date stated that another barrel exploded but fell onto a house in an uninhabited area. This witness also provided a video of the impact location. Another witness also provided a video of that impact location. While these two videos are filmed from different angles and have different lengths, they show the same scene. Not enough of the surrounding area can be seen in these videos to help determine the coordinates of the impact location. The witness who helped excavate the munition at impact location #1 but did not remember the exact date mentioned the impact in an uninhabited area too, and said that they searched but could not find this impact location.

Munition*Location #1*

26. The device at location #1 failed to explode. The witness who helped to excavate it and recalled the exact date provided four videos related to impact location #1: v01 shows the impact site; v02, the dismantling of the barrel; v03, the excavation; and v04, the barrel being loaded onto a pickup truck. That witness also provided five pictures of the munition in a courtyard. Another witness could not remember the dates of the incidents and in the interview could not describe the incident on 25-26 May 2014, but provided a USB-stick that had four pictures and a video of the munition in the same courtyard under a folder named “صور البرميل 25-5-2014”.

27. The Mechanism could not independently verify the time and location of these videos and pictures, in particular due to the fact that they were shot up close and there was a lack of surroundings on the videos (i.e., no comparators to do the analysis). The surroundings are not clearly visible in any of the footage.

28. V02 shows the unexploded barrel that looks like it landed in a hole approximately 2.5 m deep, buried more than halfway in the soil with its fins up in the air (i.e., the rear end of the barrel). Two persons are in the hole, dismantling the munition. Both persons, in addition to other people at the edge of the hole, have protective masks without canisters over their faces (i.e., those “gas masks” would be non-functioning). Also, none of the people are wearing any additional protective gear such as gloves. During the whole dismantling process, the two persons were not using any of the safety measures or equipment that would be required for this activity if hazardous substances were leaking in a confined space like the hole.

29. From what can be seen, the unexploded barrel bomb consists of an outer barrel, an inner cylinder, powder that might be explosive and detonation cords. There seems to be a significant amount of the powdery substance between the inner cylinder and the outer barrel. The inner cylinder has two valves, one of which is wrapped in large amounts of detonation cords, fixed with tape. The detonation cords go from the valve of the inner cylinder towards the bottom part of the barrel. It cannot be said if the inner cylinder is empty or filled with anything. A piece of cloth and more of the powdery substance were between the outer barrel and inner cylinder.

30. In v03, the barrel is still in the position as described above, but chains were attached. Many people, including children, surround the hole, none of them wearing protective masks or gloves. The barrel is being dragged out of the ground and the hole. When the barrel is pulled out of the hole, the damage of the outer barrel can be seen at the rear end where the fins are. The bottom of the inner cylinder is also visible and no defects or ruptures can be noticed.

31. V04 shows people dragging the barrel through a courtyard, up the stairs and loading it on a pickup truck. None of them are wearing any protection. Five pictures provided by this witness show the same munition in a tiled courtyard. It looks like all the powdery substance was removed together with the detonation cords and pieces of cloth.

32. The witness who provided the videos described the munition as follows: “On the valve of the inner cylinder was a detonator, which looked like a blue rope or blue strain and goes around the valve to detonate it so the gas could come out; and a yellow-brownish powder (about 50 kg in total) was between the inner cylinder and the outer barrel and on the top of the inner cylinder. It is there to help with the explosion.” The unexploded barrel was approximately 1.5 m long and had a cover on the top and bottom, held with screws. The barrel did not contain any markings and was locally made. The cylinder had numbers on the top, “maybe 976”. This witness stated that the device fell and impacted with the tail part first, damaging the bottom of the cylinder, and demonstrated this with a self-made drawing. On this drawing, the tails and fins of the device are shown sticking in the ground. However, in the video that the same witness provided, the tail and fin parts are above the ground and the nose-end impacted the ground first.

33. The munition in a tiled courtyard shown in the video and pictures provided by another witness matches the one in the videos.

34. In an additional open source video (v05), a person that is also seen in the videos discussed above stands next to what is assessed to be the same barrel. The person states that this was the fifth attack on Al-Tamanah with a barrel that

contained a substance that they think is chlorine, but that the barrel did not explode when it fell on soft soil. The cylinder inside released the gas slowly over the course of at least three hours. Forensic examination found a time stamp indicating the uploading date of the video to “YouTube” as 29 May 2014 at 14:23:32 UTC, although it could also have been uploaded on 28 May, two to three days after the alleged incident. However, the analysis can neither establish the date on which the video was filmed nor give information on the location.

35. In none of the videos and pictures provided can a fuse or blasting cap be seen. Hence, it cannot be determined from this material how this barrel bomb functioned. The covers on top and bottom mentioned by the witness, held with screws, were not seen in any of the videos or pictures.

36. Forensic examination of v05 stated that the munition “seems to be of the same thin metal as seen before in other cases”. According to the analysis, which is coherent with the Mechanism’s assessment, the explosion of 50 kg of explosives would have destroyed (fragmented into small pieces) the outer jacket. The munition’s effects on the surroundings would be more like those of a conventional munition rather than of a munition filled with chemicals. If this amount of explosives detonated, and the inner cylinder had contained chlorine, the chlorine would likely be oxidized which would greatly limit the effect of chlorine gas.

37. Also, it is unclear when the gas leakage took place. The witnesses said that upon arrival at the scene, they had to get gas masks because the smell was too strong. However, the gas masks in the videos were missing filter canisters. It is unclear how long after finding of barrel the dismantling, as seen in the video, started.

38. The forensic report also stated: “It is judged that the cylinder may leak gaseous substances for shorter or longer times than three hours depending of the content of the cylinder (pure gas, extent of mixing of chemicals) and the damage type and extent.”

39. The Government of the Syrian Arab Republic provided their analysis of v05, in which a person says that the cylinder leaked gas for three hours, stating that the gas in the inner cylinder would be released in seconds due to the pressure, volume, damage, temperature and impact strength. The Mechanism can neither accept nor reject this assessment, as too little is known about the specifics of the container, filling of the cylinder, damage and surroundings to exclude the possibility of a three-hour long leaking process with certainty.

Location #2

40. According to a witness, the second barrel fell onto a house which nobody lived in and exploded. The witness went to location #2 and smelled chlorine, but did not see any remnants. Another witness stated that “they” had searched, but could not find this impact location. The videos from this location show something that looks like remnants, but it cannot be said for sure.

Delivery method

41. The Government of the Syrian Arab Republic stated that they did not have any military operations on land or air at the time of the incident. Despite repeated requests, none of the sources used by the Mechanism could provide any information regarding air movements on the date in question, neither affirmative nor negative.

42. The witness who helped to excavate the munition said that on 25 May 2014, two barrels were dropped. In the open source videos described above, the speaker refers to air strikes by the “Assad” forces.

Location #1

43. Forensic examination of the footage of the munition assessed that the existence of stabilizing fins point towards the barrel bomb being constructed to be dropped from an aircraft. On hard soil, the penetration of the barrel into the ground after being dropped from a high altitude would be very limited and the damage on the barrel would be substantial, which is not the case with the barrel in the video. In soft soil, it could penetrate further down and the impact could have affected the nose/front part of the barrel in such a way as seen of the barrel depicted in the video. A witness mentioned impact in “soft soil”; however, the condition of the soil could not have been determined from the video analysis to assess whether the deep penetration of the barrel into the ground could have resulted from a high-altitude drop.

Location #2

44. There is no further specific information on location #2 with regard to the delivery method.

Damage and effects

Location #1

45. The barrel fell into a hole in the ground and failed to explode.

Location #2

46. The videos from this impact location show a lot of destruction and damage on the houses. No crater can be seen in any of the videos.

Medical effects

47. None.

Further information

48. The incident received broad media coverage. Some international media reported that the Government of the Syrian Arab Republic had used barrel bombs with toxic chemicals.

49. Several witnesses reported that local responders (sometimes specified as the “white helmets”) established basic early warning systems through local media, volunteers, hand-held radios and mosques. After the first chemical attacks, they provided information about the recommended behaviour in case of air strikes and

chemical attacks. In case of chemicals alerts, people were encouraged to move upwind of the point of impact to higher elevations, while in case of conventional attacks people were advised to seek shelter in basements.

50. Six witnesses stated that people left the village and that during the evacuation after what they said were false alarms, their own or neighbours' houses were looted. Some referred to people with "masks", potentially gas masks, who were giving face masks soaked in "Coca-Cola" or "Pepsi" to children. Two witnesses referred to rumours in town of people trying to "blame" the Government or stage the incidents.

51. A witness described an air strike on the house of an armed opposition group fighter "at the end of April". The next day, people wearing masks were "digging something out of the ground" and filming the scene, saying that Al-Tamanah was hit with toxic chlorine gas. However, the witness did not smell gas or see any injured people. When interviewed before, the same witness had not mentioned this incident.

52. Some of the witnesses said that armed men, some of them from Al-Tamanah and some foreigners from other countries, were issuing false chemical alarms saying that the Government of the Syrian Arab Republic military would attack the village with chemicals, sometimes saying chlorine, and telling people to leave the village. These alerts were issued in different ways, from vehicles with microphones, mosques or just telling people in person. Two witnesses mention the same person who was allegedly filming the "staged" scenarios.

53. One witness said that people were knocking on the door. People on motorcycles and cars told people to leave the house because a plane was going to attack. Children of different ages were running after them. Apparently the people, which the witness believes to belong to the Nusra Front, went to the school, took the children out and gave them diapers soaked with a liquid in order to use them as gas masks, claiming that chlorine would be used in the air strike. The witness stayed at home despite the warning and did not smell or see anything.

The Leadership Panel's assessment

54. The Leadership Panel examined the existing information and evidence regarding the incident in Al-Tamanah on 25-26 May 2014 and determined that there was insufficient evidence to draw a conclusion on the actors involved and the modality of the use of chemicals as weapons in this incident.

55. This assessment was based on the following:

- There is scarcity of relevant information about all incidents in Al-Tamanah. No flight movements could be established by the Mechanism.
- Several witnesses stated that since April 2014, "false" chemical weapons alerts occurred frequently in non-regular intervals and that no chemicals had ever been used as weapons in Al-Tamanah.
- Other witnesses informed of an unexploded "barrel bomb" which leaked chlorine. However, there was insufficient evidence to corroborate these testimonies.

Annex VII

Qmenas, 16 March 2015

Findings of the OPCW Fact-Finding Mission in the Syrian Arab Republic

1. The Fact-Finding Mission (FFM) report (S/2015/908, page 84, paragraph 3.8) refers to an incident on the night of 16 March 2015 between 2000 and 2100 hours: "... the occupants of the houses situated in the eastern and north-eastern part of the village, relatively close to the impact point, smelled an odour similar to chlorine-based household cleaning agents, but much more intense." (S/2015/908, page 84, paragraph 3.9)
2. "From the 60 or so individuals who arrived from Qmenas to the Sarmin field hospital on 16 March 2015, 40 cases had clinical signs of anxiety, six cases were considered as secondary exposure (one treating physician and five first responders), and 14 patients were considered as directly exposed." (S/2015/908, page 84, paragraph 3.12)
3. "In itself, no one source of information or evidence would lend particularly strong weighting as to whether there was an event that had used a toxic chemical as a weapon. However, taken in their entirety, sufficient facts were collected to conclude that incidents in the Syrian Arab Republic likely involved the use of a toxic chemical as a weapon. There is insufficient evidence to come to any firm conclusions as to the identification of the chemical, although there are factors indicating that the chemical probably contained the element chlorine." (S/2015/908, page 151, paragraph 5.19)

The Mechanism's investigation

Background

4. Qmenas (Idlib Governorate, Idlib District) is located 6 km south-east of Idlib city. Sarmin is less than 5 km to the northeast and Saraqib 12 km to the east, the latter located at the junction of the M5 Damascus-Aleppo and M4 Latakia motorways. The airfield of Taftanaz is approximately 13 km linear distance in the north-east.
5. In the 2004 census, the village of Qmenas had about 2,700 inhabitants. In August 2014, a report from the Office for the Coordination of Humanitarian Affairs recorded high numbers of internally displaced persons (IDPs) in Idlib District. Some sources report that Qmenas still had a large population, as many people from Idlib city had been displaced there and often stayed with relatives, while other sources state that the village had been depopulated due to the proximity to the frontline.
6. In 2014, Government presence in Idlib had consisted of networks of checkpoints and military installations: one running along the M5 between Ma'arrat al-Numan and Khan Sheikhoun, and the other along the M4 connecting Latakia to Idlib city.

7. In summer 2014, the Nusrah Front¹ started to fight armed opposition groups in Idlib, many of whom it had been fighting alongside against the Government. Those included Jabhat al-Thuwar and Harakat Hazm. The Nusrah Front took control of several regions and towns in Idlib Governorate, in addition to weapons and facilities of the groups it defeated.

8. On 15 December 2014, the Nusrah Front, as well as Ahrar ash-Sham, Jund al-Aqsa and fighters from armed opposition groups captured the military bases of Wadi al-Deif and Al-Hamidiyah and thus controlled the M5 motorway north of Morek and several military checkpoints, cutting an important Government access route to Idlib and consolidating their presence in the southern part of Idlib Governorate.

9. Qmenas and Sarmin, immediately to the west of Idlib City, were controlled by armed opposition groups and right next to the frontline. Towards the east, Saraqib at the strategic M5-M4 junction and Taftanaz Military Airbase had been under the control of armed opposition groups since November 2012 and January 2013, respectively.

10. The Government of the Syrian Arab Republic controlled Idlib city and military bases south of Idlib, 4 km west of Qmenas.

11. On 24 March 2015, several factions officially announced the formation of Jaish al-Fatah and commenced operations to seize Idlib city, temporarily succeeding on 28 March 2015, after heavy clashes. The founding members of Jaish al-Fatah included Nusrah Front, Ahrar ash-Sham, Jund al-Aqsa, Failaq al-Sham and others.

12. Qmenas served as one of the bases to prepare the Idlib offensive, with the presence of Nusrah Front and other Jaish al-Fatah factions. While some sources stated that Ahrar ash-Sham controlled the village, the group did not confirm that. Witnesses reported of military installations in the village, without specifying the affiliation of fighters or groups.

13. A witness stated that armed groups were preparing to attack Idlib “in order to liberate it”, and that the incident occurred a few days before the offensive started. According to the same witness, fighters were positioned in Qmenas and on the road to Sarmin awaiting the attack.

14. Between 16 March and 20 May 2015, the incident in Qmenas was the first of several incidents reported in and around Idlib city where chemicals were used as weapons, as recorded by the FFM. However, it remained the only incident in Qmenas. The incidents in Sarmin in the same night occurred only two to three hours later.

15. Qmenas does not have any health-care facilities; the next available medical facilities are the field hospital in Sarmin and the general hospital in Saraqib.

Narrative

16. The description that emerged from the testimony of FFM witnesses was that a helicopter dropped two items or “barrel bombs” at the edge of a military zone. A

¹ On 30 May 2013, the Nusrah Front was designated as a terrorist group by the Security Council under resolution 1267 (1999).

few minutes later, the witnesses noticed a chlorine-like odour. Those exposed suffered from tearing of the eyes, coughing and breathing difficulties. A chemical alert was issued through a local warning system, causing panic.

17. The Government of the Syrian Arab Republic denied any air movements in that area that day and provided a different explanation of the exposure of people to chemical substances. The Government reported that Jund al-Aqsa fighters transported barrels filled with an unidentified liquid from underground hollows known as Maghawir al-Dawash, located between Sarmin and Qmenas. One of the barrels fell from the vehicle, releasing gas that affected the fighters and some residents from Qmenas and Sarmin. All suffered from “asphyxiation”.

18. In the course of the investigation, the Government of the Syrian Arab Republic provided information indicating that opposition fighters used a hell-cannon filled with chemicals against other armed opposition groups. Due to the lack of supporting information and inconsistency with the Mechanism’s findings, the use of a hell-cannon has been excluded as a viable option.

Date and time

19. Three witnesses confirmed the date of the event occurred on 16 March 2015. The indications of the time diverge slightly, but focus around 2000 and 2100 hours. Four Member States provided information that supports the time of the incidents. The Government of the Syrian Arab Republic confirmed the date of the incident involving chemicals, but did not provide a time.

Weather conditions

20. The sunset in Qmenas on 16 March 2015 was at 1741 hours. From 2000 to 2100 hours, the temperature was at 10°C with wind from the west (260°) at a speed of 3 m/s. The humidity was at 95 per cent.

Impact location

21. One witness stated that both “barrel bombs” impacted inside a military zone; another said that only one impacted inside the military zone and the other one in a residential area.

22. The Maghawir al-Dawash hollows are located at the south-west outskirts of the village of Sarmin, near the road to Qmenas. The distance between the hollows and Qmenas is approximately 3 km.

Location #1

23. Three witnesses showed the impact location on a map, at the outskirts of Qmenas on the road to Al-Nerab. The differences in the coordinates were minimal.

24. In order to corroborate the location, ten images of the alleged impact location were examined by a forensic institute. It concluded that all ten included image content that visually linked the images together and thus could confirm that all the images depict the same place. The metadata examination and visual analysis did not show any sign of manipulation.

25. There are no signs indicating that the pictures were altered to include the remnants. Since the pictures were taken two days after the attack, it cannot be ruled out that the remnants could have possibly been placed at the location beforehand.

26. Through visual comparison of the pictures with satellite images, the forensics specialist determined geographical coordinates of this location matching those shown by the witnesses.

Coordinates of location #1 as provided by different sources

<i>Source</i>	<i>Latitude (decimal)</i>	<i>Longitude (decimal)</i>
Witness	N35.882889°	E36.680778°
Witness	N35.882833°	E36.681222°
Witness	N35.882833°	E36.680722°
Forensic institute	N35.882772°	E36.681096°

Location #2

27. Only one witness gave information on the second impact location as N35.882972° and E36.679111°. This is close to location #1, further inside the village. The Mechanism had neither found any additional information to confirm the coordinates for location #2, nor any other information on the barrel bomb that allegedly fell there. Two witnesses stated that a military facility or militarized zone was impacted, and that civilians were affected because the wind had carried the gas to a residential area. The kind of military installation or presence, as well as the military actor, could not be established, apart from the fact that it was not a SAAF facility, but related to an armed opposition or other group.

Munition

28. The following considerations are derived from the analysis of location #1, as no further information is available on location #2.

29. Witnesses described the remnants of the device as a metallic barrel or drum, with a number of exploded gas canisters. This description matches with pictures analysed by the Mechanism and forensic institutes. The metallic barrel, which is possibly the outer jacket of the bomb, has fins. A small exploded canister of a blue-greenish colour is also visible in the pictures. Regarding authenticity, the forensic analysis of the picture concluded that the results of the examination support that the images have not been manipulated and that the photographs were taken two days after the event.

30. Witnesses described a marking on the barrel “IYAD”, but this cannot be seen in any of the pictures.

31. According to explosive experts, if the barrel had contained high explosives, the outer jacket would most probably have splintered into small pieces and completely destroyed. It is also possible that the explosive filler did not explode, but that would not explain the canisters found.

32. The remnants seen in this and other pictures look like the remnants seen in Sarmin (canisters and the outer jacket), from the incident that occurred at the same day.

Delivery method

33. Witnesses stated that they heard helicopters and the sound of an explosion which they described as “muted” in comparison with other air-strike impacts. Shortly after, they stated to have received a chemical weapon alert through hand-held radios and the loudspeakers of the minarets of the mosques.

34. A witness described an intercepted radio communication of two helicopter pilots, allegedly using the call sign “Bravo”. According to this testimony, a helicopter took off from Latakia airport around 2100 hours. A few moments after the pilot had informed having “entered the working area”; residents reported the impact of a barrel bomb. This occurred around 2130 hours. From Latakia airbase to Qmenas, a helicopter would take 30 to 33 minutes.

35. After reviewing the type of helicopters that are within the SAAF fleet and the distance from Latakia airport to Qmenas, the witness’ assessment on the time needed to reach Qmenas from Latakia is considered correct.

36. The Mechanism gathered information that a helicopter departed the Bassel al-Assad Airport in Latakia at 2030 hours and passed over Qmenas at 2105 hours, returning to the base at 2130 hours.

37. The Government of the Syrian Arab Republic stated that there was no flight activity at that day in that area, but did not provide any supporting documentations, such as flight records. The Government did not respond to questions regarding the call signs used.

Location #1

38. A defence institute studied the images of the remnants and stated that the outer barrel “has the hallmarks of being dropped from an aircraft. The stabilizing fins are clearly visible as well as a mount for attaching the device to the aircraft. This [barrel bomb] has probably been carried underneath the wings or hull of an aircraft (fixed-wing or helicopter). It is doubtful it was carried by a rocket”.

39. A ballistic expert and a defence institute studied the crater formed at location #1 with regard to determining the delivery method. The crater on the pictures can be observed on satellite imagery dated after 16 March 2015 at the determined location.

40. The ballistics expert concluded that “a bomb, dropped from a helicopter at high altitude, and hitting the ground somewhat obliquely, would be quite likely to create an impact mark looking similar to the one shown in” the crater of location #1. The expert noted that the crater had changed between the moment of impact and when the picture was taken: “On the image it appears that a heavy lorry may have driven across the mark after it was made. It could also be possible that some material was filled back into the hole before the photo was taken, if it had been somewhat deeper, to permit traffic to pass unobstructed.”

41. The defence research institute concluded that the image of the crater was consistent with an object dropped from high altitude onto a hard surface. It was noted that they could not rule out the possibility that “it was simply a bad road” or that someone had dug a hole. They also noted that there were no obvious signs of a large detonation, therefore, the device either contained a low amount of explosives or the explosive filler did not function properly.

42. The Mechanism, with support from several external expert analyses, assessed the possibility that the munition found was launched from a land-based launcher. However, this is considered not feasible.

Location #2

43. No information was available on the second location mentioned by witnesses, which potentially was located in a militarized zone.

Damage and effects

Location #1

44. Witnesses stated that the soil around location #1 had partly changed its colour to reddish-pink. Such colouring on the soil is not visible on any of the photos.

45. The pictures of the impact location show a visible discolouration of the vegetation. A satellite image vegetation index analysis showed “less healthy” vegetation in the north and east of the crater. While damage and effects would suggest the use of chlorine or other toxic chemicals, the Mechanism could not rule out other possible causes.

Location #2

46. No information was made available on the second location.

Medical effects

47. According to witnesses, the ambulances were dispatched to Qmenas after the alerts, but they arrived when all those affected had left the village. One witness stated that some people stopped the ambulances and told them to return, as all patients had already left.

48. Three witnesses confirmed the number of patients as described in the FFM report ([S/2015/908](#)). According to these statements, Sarmin hospital from 2045 hours onwards, 60 people sought medical assistance; however, the medical staff assessed that only 20 of them presented clinical symptoms related to chemical exposure, while the others presented symptoms related to anxiety and panic. A witness stated that some opposition fighters were exposed and treated by their military units within their area. There were no deaths reported.

49. Witnesses confirmed the number of patients and provided some names, however, no medical records were provided, despite several requests.

50. The information available on the amount of chlorine, gas and dispersion rate, obstacles and topography was not sufficient for a scientific analysis of the potential chlorine dispersion. With this in mind, the Mechanism used part of the model

dispersion model provided by a defense research institute, the established impact location and weather information at the time corroborated to assess whether the number of affected people was in the realm of possible. Noting the lack of information of the exact conditions, this seemed to be the case.

51. The Government of the Syrian Arab Republic stated that people in both Sarmin and Qmenas had been affected as a result of the car accident with a barrel containing chlorine. The numbers of people affected according to this statement are lower than the numbers provided by the hospital in Sarmin and other witnesses.

52. To affect the population of Qmenas, this accident would have had to have occurred on the outskirts of the village of Qmenas. Anywhere further in the direction of Sarmin, the exposure of Qmenas civilians would be significantly reduced. However, if the car accident was close to Qmenas, the population in Sarmin would not have been exposed to chlorine gas or other toxic gaseous substance, as the direction of the wind was not towards the east and the dispersion would have passed by Sarmin in the south.

The Leadership Panel's assessment

53. The Leadership Panel examined the existing information regarding the incident in Qmenas on 16 March 2015 and determined that a SAAF helicopter dropped one device or barrel bomb in Qmenas.

54. The Leadership Panel was close to having sufficient information to reach a conclusion on the actors involved, however, at this stage the Panel could not draw a conclusion with certainty as to whether the device or barrel bomb contained explosives or chlorine in this incident.

55. The Leadership Panel determined that this case merits further investigation.

56. This assessment was based on the following:

- According to witness statements, a helicopter dropped two devices at the edge of a military zone in Qmenas. However, only one impact location as provided by three different witnesses could be corroborated through forensic analysis of pictures and satellite images.
- The remnants of a device found near the impact crater resemble the remnants of barrel bombs found near other impact sites, most notably in Sarmin. Nevertheless, from the analysis of the remnants and the crater it was not possible to determine if the device contained explosives or toxic chemicals.
- The Mechanism was offered alternative descriptions of the event, such as the accidental release of gas from a barrel that fell from a vehicle operated by an armed opposition group, or opposition fighters using a "hell-cannon" filled with chemicals against other armed opposition groups. The Mechanism was unable to obtain any credible information that would support those alternatives.
- The Mechanism obtained information that a helicopter passed over Qmenas on the date and time of the incident.

- The Government of the Syrian Arab Republic indicated that there had not been any SAAF flights on 16 March 2015 in the area, but did not provide any supporting information. However, the Mechanism obtained information from other sources, which corroborate the helicopter flights on the date and time of the incident.
- At the time when the incident occurred, the Government of the Syrian Arab Republic had lost control of six airbases, including Taftanaz airbase (Idlib Governorate). The Government informed the Mechanism that 15 helicopters were left behind of at Taftanaz airbase, nine of which were deemed operational.
- The Leadership Panel reviewed all of the information gathered and found no evidence that armed opposition groups in Qmenas were operating a helicopter at the time and location of the incident.

Annex VIII

Sarmin, 16 March 2015

Findings of the OPCW Fact-Finding Mission in the Syrian Arab Republic

1. The Fact-Finding Mission (FFM) described two incidents that occurred on 16 March 2015 between 2230 and 2300 hours in Sarmin. (S/2015/908, page 90, paragraph 3.29)
2. “Between 3 May and 5 June 2015 the FFM team interviewed 21 individuals who provided accounts and information regarding incidents of alleged use of toxic chemicals as a weapon in and close to this village on 16 March, 23 March, and 26 March 2015, and 16 May 2015.” (S/2015/908, page 90, paragraph 3.35)
3. “In itself, no one source of information or evidence would lend particularly strong weighting as to whether there was an event that had used a toxic chemical as a weapon. However, taken in their entirety, sufficient facts were collected to conclude that incidents in the Syrian Arab Republic likely involved the use of a toxic chemical as a weapon. There is insufficient evidence to come to any firm conclusions as to the identification of the chemical, although there are factors indicating that the chemical probably contained the element chlorine.” (S/2015/908, page 151, paragraph 5.19)

The Mechanism’s investigation

Background

4. Sarmin (Idlib Governorate, Idlib District) is approximately 7-8 km south-east of the eastern outskirts of Idlib city, on the road to Saraqib. Binnish is approximately 5-6 km north of Sarmin, while the airfield of Taftanaz is 8 km north-east. Qmenas is 5 km to the south-west of Sarmin. The Bassel Al-Assad Airport in Latakia is located approximately 85 km away on the Mediterranean coast.
5. In the 2004 census, Sarmin had approximately 14,500 inhabitants. According to the FFM, due to the proximity of the front lines, Sarmin had been depopulated in 2015 to less than 5,000 people. In August 2014, The United Nations Office for the Coordination of Humanitarian Affairs had identified only 2,500 people in need in Sarmin and no internally displaced persons (IDPs), but a high number of IDPs were recorded in Idlib District. Other statements, however, have indicated that Sarmin still had a large population, and many of the IDPs had relocated there from Idlib.
6. In 2014, Government presence in Idlib had consisted of networks of checkpoints and military installations, one running along the M5 between the towns of Ma’arrat al-Numan and Khan Sheikhoun and the other along the M4 connecting Latakia to the city of Idlib.

7. In the summer of 2014, the Nusra Front¹ began to clash with many of the armed opposition groups it had been fighting alongside against the Government before. Those included Jabhat al-Thuwar and Harakat Hazm. Consequently, the Nusra Front took control of several regions and towns in Idlib Governorate, in addition to some of the weapons and facilities of those armed opposition groups.

8. On 15 December 2014, the Nusra Front, as well as Ahrar ash-Sham, Jund al-Aqsa and fighters from other armed opposition groups captured the military bases Wadi al-Deif and Al-Hamidiyah, south of Ma'arat al-Nu'man, and thus gained control of the strategic M5 motorway north of Morek and several military checkpoints. This cut an important access route to Idlib, impeding the ability of Government of the Syrian Arab Republic to resupply its forces within the city and surrounding area.

9. By March 2015, Qmenas and Sarmin, immediately to the east of Idlib city, were controlled by armed opposition groups, as was Binnish to the north. Sarmin had been largely controlled by Liwa Dawoud until 2014, when the group's commander defected to join the Islamic State in Iraq and the Levant (ISIL). Some 100 fighters reportedly declined and returned to Sarmin to join other groups. Ahrar ash-Sham did confirm its presence in March 2015. Failaq al-Sham and other factions of Jaish al-Fatah were likely present.

10. Further to the east, both Saraqib and Taftanaz Military Airbase were also under control of armed opposition groups from November 2012 and January 2013, respectively.

11. The Government of the Syrian Arab Republic still controlled Idlib city and the military bases near Almastumah, south of Idlib. Pro-Government paramilitary National Defense Forces (NDFs) also controlled the nearby communities of Fouah and Kafraya, north of Binnish.

12. On 16 March 2015, there were two allegations of the use of chemicals as weapons in Sarmin and one in Qmenas. A witness stated that on 16 March 2015, the armed groups located in Qmenas and on the road from Qmenas to Sarmin had been preparing for the attack on Idlib city (which commenced 24 March 2015).

13. On 24 March 2015, several groups officially announced the formation of Jaish al-Fatah (elements included the Nusra Front, Ahrar ash-Sham, Jund al-Aqsa, Failaq al-Sham and several other), which commenced operations to seize Idlib city. The city fell to their control on 28 March 2015.

14. By the end of May 2015, the FFM recorded allegations of five incidents of alleged use of chemicals as weapons in Sarmin.

15. Sarmin has one primary health-care centre, one private clinic and one field hospital, which was previously supported by the Syrian Arab Red Crescent (SARC), and now also by the Syrian American Medical Society (SAMS).

¹ On 30 May 2013, the Nusra Front was designated as a terrorist group by the Security Council under resolution 1267 (1999).

Narratives

16. The description that emerged from the FFM is that on 16 March 2015 around 2230 to 2300 hours local time, a helicopter dropped two barrel bombs filled with chlorine or chlorine derivative, resulting in the release of chlorine gas. One fell on an open field (location #1). The other fell through the ventilation shaft of a partially built house (location #2). There was a family of six living in the basement of the house, all of whom died in the incident. The population was warned through a local early warning system. Those close to the impact described the odour of chlorine. Twenty-six people were treated in the hospitals of Saraqib and Sarmin after experiencing a feeling of suffocation.

17. The Government of the Syrian Arab Republic denied any air movements in the area that day and provided a different explanation of the people's exposure to chemical substances. The Government explained that Jund al-Aqsa fighters transported barrels filled with an unidentified liquid from underground hollows known as Maghawir al-Dawash, located between Sarmin and Qmenas. During a car accident, one of the barrels fell from the vehicle (location #3), releasing gas that affected the fighters as well as some residents in both Qmenas and Sarmin. All suffered from "asphyxiation".

18. Another description of the events, as given by another source, indicated that an air strike from the Syrian Arab Armed Forces (SAAF) in the vicinity of Sarmin around 2200 hours destroyed depots with conventional ammunition and non-poisonous chemicals. A fire led to the release of "caustic combustion gases" from the chemical agents, which was then used as a pretext for allegations against the Government of the Syrian Arab Republic. The Mechanism could not obtain information to confirm an air strike or the explosion of a munition depot. The Government of the Syrian Arab Republic stated that overflights were very common in that period but denied that there were any air operations on 16 March 2015, although they did not provide any documentation to support this.

Date and time

19. Three witnesses confirmed that the two incidents occurred on 16 March 2015 at approximately 2230 hours. No exact time was given for the alleged car accident or air strike on a munition depot.

Weather conditions

20. The sunset in Sarmin on 16 March 2015 was at 1741 hours. From 2200 to 2300 hours, the temperature ranged from 9°C to 10°C. The wind came from the west (260°) with a wind speed of 3 m/s. The relative humidity was at 96 per cent.

Impact location

Location #1

21. A witness' statement identified the first impact location in an agricultural field, adjacent to a target of potential military interest, at N35.902407° and E36.729282°.

22. Photos and videos from the Sarmin incident were forensically analysed for metadata extraction, image analysis and manipulation. A forensic institute, through

image analysis and visual comparison with satellite images, confirmed the impact location.

Location #2

23. Three witnesses identified the house on a map where a device fell and six people died. Through analysis of photos, satellite images and videos the following coordinates were identified as the second impact location: N35.903257° and 36.729642E°.

24. The forensic institute, through image analysis and visual comparison with satellite images, confirmed the impact location.

25. Locations #1 and #2 are 90 metres apart. While no GPS coordinates or time stamp could be obtained from material, the forensic analysis established that all photographs and videos submitted include image content that was linked to at least one other image for the two locations. Nine pictures and seven videos have been analysed by a forensic institute.

Coordinates of location #2 as provided by different sources

<i>Source</i>	<i>Latitude (decimal)</i>	<i>Longitude (decimal)</i>
Witness	N35.903257°	E36.729642°
Witness	N35.903214°	E36.729650°
Witness	N35.903197°	E36.729594°
Forensic analysis	N35.903257°	E36.729642°

Location #3

26. The Maghawir al-Dawash hollows are located at the south-west outskirts of the village of Sarmin, close to a road that links Sarmin to Qmenas (N35.897722° E36.714589°). The exact location of the alleged car accident could not be determined.

Munition

Location #1

27. Three witnesses described “a barrel” (parts of the outer jacket) and several “canisters”. One of them stated that the canisters looked like those filled with refrigerant gas for refrigerators. That witness also described the odour of chlorine.

28. One witness described the outer jacket as a 125-cm long “make-shift” weapon, which was “obvious[ly] locally made”. It had three or four iron rollers, which were fixed rollers that could function as wheels. The barrel bomb was made of a thick metal.

29. The Mechanism analysed several pictures of the remnants of the munition and submitted several of them for forensic analysis. While no signs of manipulation of the pictures could be found, it appears that the remnants have been moved from the point of impact (crater) to the road.

30. The pictures show several exploded canisters, as well as pieces that were most probably parts of the outer jacket (“barrel”). On the outer jacket, “stabilizing fins” and the “wheels” can be seen.

31. According to explosive experts, the large size of the remnant parts of the outer jacket, indicate a smaller explosive charge. If the barrel had been filled with large amounts of explosives, it would likely have disintegrated into very small fragments. Theoretically, if a larger explosive charge did not function properly, the size of the remnants could be larger. However, no remaining explosives can be seen in the pictures.

Location #2

32. A witness said that the size of the munition (“barrel”) was 150 cm in height and 60 cm or more in diameter. The witness stated that there were several gas canisters of the kind filled with refrigerant gas used in air conditioners. The canisters’ had English inscriptions. The inside of the canisters was of a yellow colour. A video shows the remnants, damage and debris in each room of the house, as described by the witness. This witness had seen this several hours after the attack.

33. Several videos and pictures provided by witnesses and retrieved from open sources show the impact location and remnants. This includes videos taken by first responders who tried to enter the house during the night through thick smoke to rescue the family members in the basement, as well as videos showing the impact scene the next day. The device is understood to have fallen into a kitchen area. The outer jacket is visible in the pictures, in addition to a cylinder from a heating system that is not part of the munition. There is a lot of rubble and parts of a collapsed structure, while the dishes and items in the kitchen shelf are in place. In other videos, the kitchen shelves have been emptied, indicating that this video has been taken at an even later stage.

34. Some pictures and videos show exploded refrigerant canisters, as described by the witnesses, in addition to a reddish or purple substance on the floor. This is understood to be possibly from potassium permanganate. According to a forensic institute, potassium permanganate would be delivered as a powder. The purple liquid phase would be caused by a secondary effect, such as contact with water.

35. The FFM has been provided with samples, which were analysed in an OPCW-designated laboratory to determine whether any chemical substance had been used. Neither the FFM nor the Mechanism was able to establish the full chain of custody for these samples.

36. The canisters are HCFC² gas canisters used in different household items, such as refrigerators and air conditioners. Based on the scripts on a canister, it appears that the canisters are manufactured according to United States standard, as non-reusable canisters for disposal after use. The several canisters were produced by different manufacturers. These canisters could have been easily retrieved. However, to refill and repurpose the canisters to be part of the device, some modifications would have been necessary. A Member State provided the analysis that refilling the

² Hydrochlorofluorocarbon.

canisters would bear a high risk and require modification of the valves. For this process, some technical expertise and equipment, including the ability to create conducive conditions, would be required.

37. The indentation line, fractures and cuts in the metallic canister seem to be consistent with the use of a detonation cord. A blasting cap, fitted with the fuze, appears to have been taped to the base of the barrel, and the detonation cords fitted to the blasting cap and taped around the cylinders.

38. The plastic bottles are believed to be 500-ml-PET bottles filled with potassium permanganate (KMnO₄). Mixing with the content of the refrigerant containers upon explosion, the potassium permanganate would have generated the chlorine. As discussed above, the potassium permanganate could have caused the purple colour of the soil. Potassium permanganate is used in pharmaceutical products, water treatment, disinfection products and for other civilian purposes; however, chlorine may be produced by the reaction of hydrochloric acid (HCl) with KMnO₄.

39. The laboratory analysis did not provide sufficient evidence to confirm the exact composition of the toxic substance used, but strongly supported the use of chlorine or a chlorine derivative. Higher concentrations of chloride were found in the inner surface of the refrigerant cylinders, compared with the exterior surface. This indicates that a chlorine containing substance was in the cylinders, either in the form of chlorine or HCl.

40. The presence of bornyl chloride was also found in a piece of wood removed from the affected building. This substance is the product of the reaction of HCl or chlorine (Cl₂) with alpha-pinene, a terpene-based wood ingredient.

41. It has been suggested that this could indicate a two-component reaction needed to produce the toxic substances, and other less toxic chemicals are contained in the device and brought to reaction upon impact. This theory has been supported by analysis provided by another source.

42. The presence of trinitrotoluene (TNT) was identified in some of the samples. This explosive is not normally found in detonation cords or in the cylinders and the hypothesis of the working model described above would not explain the presence of TNT. Traces of TNT may possibly be present due to contamination of the munition parts during construction. However, this needs additional analysis to verify the presence of explosives to allow a definitive conclusion.

Location #3

43. No further information could be found on a barrel of chemicals that fell from a truck, as indicated by the Government of the Syrian Arab Republic.

Delivery method

44. Eight witnesses heard at least one helicopter flying over Sarmin between 2230 and 2300 hours. Several of them stated that the helicopter(s) dropped two items. The statements about how much time was between the impacts are slightly diverging. The sound of the falling items was described as a diving fighter jet sound, followed by a soft explosion.

45. One witness heard through a radio communication system used to intercept SAAF communication that a helicopter took off from Latakia airbase. The witness stated that one helicopter was returning to Latakia airbase after having dropped a barrel bomb on Qmenas at approximately 2130 hours. The helicopter flew over Sarmin between 2230 and 2330 hours and dropped two items. The pilot communicated with the base twice about having “executed”, with a difference of one minute. Then, the pilot informed the base and said “Sir, the barrels are at the terrorist area”.

46. One source shared their assessment that a helicopter departed from Latakia (Bassel al-Assad Airport) at 2215 hours and flew over Sarmin around 2250 hours, returning to base at 2325 hours. The Government of the Syrian Arab Republic stated that there had not been any SAAF flights from Latakia or other airbases in the region on 16 March 2015, but, despite repeated requests, did not provide any supporting information (e.g., flight plans).

Location #1

47. The Mechanism analysed the impact, remnants and crater with a view to find out about the delivery method. Experts agree that the launch of a barrel of the size and kind described above from a land-based cannon or mortar-like launching system is not feasible, and highly unlikely from a rocket-based launcher.

48. Asked if the crater could result from the impact of a bomb dropped from a helicopter from high altitude, the expert stated that this was “quite likely”. The expert had used the following calculation: A steel barrel bomb of 60 cm diameter and 150 cm length, containing nine pressure tanks/canisters, filled with either hydrochloric acid or chlorine, and weighing approximately 390 kg.

49. A defence institute analysed the pictures of the remnants and conveyed its view that it had the “hallmarks of being dropped from an aircraft. Stabilizing fins are clearly visible [...] and also a mount for attaching the device to the aircraft”.

Location #2

50. A ballistic expert analysis supports the statement of the witnesses, improbable as it sounds, that the device impacted through the ventilation shaft. There is a pale whitish mark on the right side of the shaft, which is likely the impact mark.

51. According to another forensic analysis, the deformation of the canisters and the plastic bottles is consistent with a mechanical impact, such as upon impact on the ground, and an explosive rupture, most probably through the detonation cord, set-off by the blasting cap. The sound produced at the impact would not be expected to be as loud as a device filled with explosives.

52. Another laboratory states that from the samples, it was “difficult to fathom” that the device was launched from the ground. The weight and location of the remnants would suggest that they fell from a helicopter, as this device would have been too heavy to launch from the ground. In addition, the canisters would have fallen further apart.

Location #3

53. The barrel “with an unidentified liquid” fell from a truck. No further information has been provided on the nature and filling of this barrel or the truck.

Damage and Effects*Location #1*

54. According to a witness, the crater was 150 cm wide and 50 cm (or 75 cm) deep, which matches with the crater seen in the pictures, as well as several open source videos. A ballistic expert studied the crater and estimated the size as approximately 250 cm in diameter and less than 70 cm in depth, however, cautioning that matter could have fallen back into it after the actual impact, reducing the depth.

55. Differences in the colour of the grass can be observed around the crater. A satellite image vegetation index analysis shows “less healthy” vegetation at the open field on which the crater is (location #1) next to location #2. It is possible that this could have been caused by chlorine or other toxic chemicals, but it is also possible that there are other causes.

Location #2

56. The entry point of the device into the residential house (location #2) was a ventilation shaft. The device fell to the basement of a partially built house, and impacted in the kitchen. In the basement were, apart from the kitchen, three bedrooms and a hall. There is no crater; however, the basement of the house was partially destroyed.

57. A ballistic expert stated that the bomb appeared to have impacted onto the kitchen wall. In the expert’s view, the fact that objects and shelves appear relatively intact would exclude a major explosion. The structure or vault on its top might rather have collapsed when the kitchen wall was impacted, but it may also have been directly impacted. The damage could have been caused by the device impacting on one end of the ventilation shaft, bouncing against the rock wall, impacting walls and other structures below the upper floor, which when collapsing, pulled with it other parts of the ceiling and possibly a staircase. A defence institute shared this assessment and concluded that it was possible that the damage was caused by the kinetic effect of the impact (i.e., the barrel bomb broke the structure of the building after falling from high altitude).

58. The Government of the Syrian Arab Republic stated that the cause of the explosion of the house was an accident with a LPG³ (cooking gas) cylinder. However, there is no evidence of fire inside the kitchen, which reduces the probability of an accident with LPG.

59. Also, as an expert analysis points out, there was no apparent blackening of the walls, which would be expected in an explosion or detonation of any high explosive. There were only signs of a very minor explosion, such as a detonating cord, having occurred, if any at all. A defence research institute noted that if there had been a large

³ Liquified petroleum gas, often referred to as propane.

detonation, there should have been (a) more signs of scourging; (b) more damage to the items in the background; and (c) less remnants of the barrel bomb itself.

Medical effects

60. According to witnesses, 17 patients were treated by the Sarmin Field Hospital and 11 by the Saraqib Field Hospital. In addition, witnesses stated that 20 civil defence personnel also received first aid treatment as they had suffered secondary exposure. All six members of the family living at location #2 died.

61. A witness stated that a man, his wife and their youngest child managed to get out of the house and called for help. The eyewitnesses described an irritating smell, similar to chlorine used as a household cleaning agent but much more intense. This odour immediately induced coughing and a feeling of suffocation among all who were exposed. The three family members were brought to the Sarmin Field Hospital. The woman told first responders that the grandmother and two children were still in the house. Several first responders tried to rescue them but had to return because they were affected and suffered from symptoms (“suffocation”) when they entered the house.

62. None of the witnesses provided information on how the other family members were finally evacuated. However, in the video material they appear in the hospital. The grandmother is apparently dead and the two other children are unresponsive.

63. A witness provided reports signed by medical doctors at the Sarmin hospital, confirming the deaths of the six family members, but not certifying the cause of death.

64. In an attempt to estimate the number of people that would likely be exposed to the release of chlorine, a basic simulation exercise of the possible chlorine dispersion was carried out. The exercise presents the probability and severity of injuries, considering the theoretical concentration of this chemical in the atmosphere.

65. To assess a more reliable number of casualties, certain aspects, such as position and distance from the terrain, rate of dispersion of the substance at source, urban characteristics and obstacles, topography and actual population density and characteristics (gender, age, pre-existing conditions, etc.) would need to be known. Nevertheless, with this in mind, the Mechanism used part of the model to assess the effect on the population exposed.

66. The death of six persons in this case may be explained as exposure that occurred in an underground confined space. As chlorine is heavier than air it would be directed to and remain in the lowest areas where it was released (i.e., the basement).

67. The model had predicted a higher number of affected people (91), based on a calculation in the city centre. Applying the predicted chlorine plume to the actual weather conditions and the impact location in the outskirts of the village, a lower number of affected people would be expected. The exact population density in the area at the time of the incident could not be established with certainty, thus, no exact calculation can be made.

68. In relation to the incident in which a barrel fell from a truck, it is noted that the accident would have had to happen quite close to Sarmin, in the vicinity of the Maghawir al-Dawash hollows, to cause exposure of any patients in Sarmin.

Considering the wind direction, in an accident close to Sarmin on the road to Qmenas, a toxic gas could have been carried to Sarmin and affected people at the outskirts of Sarmin, particularly on its south-western border. However, this could not explain the people exposed in eastern Sarmin.

69. This accident allegedly affected the population of Qmenas and Sarmin. In order to affect the population in Qmenas, it would have had to occur near the outskirts of Qmenas, maximal 500 m from the centre of Qmenas. However, in that case it would be impossible for the population in Sarmin to be exposed to chlorine gas or other toxic gaseous substance, as the direction of the wind was not towards Sarmin but towards the south of the village.

The Leadership Panel's assessments

70. The Leadership Panel examined the existing information regarding the two impact locations in Sarmin on 16 March 2015. There is sufficient information for the Leadership Panel to conclude that the incident at impact location #2 was caused by an SAAF helicopter dropping a device which hit the house and was followed by the release of a toxic substance, which match the characteristics of chlorine, that was fatal to all (6) occupants. The remnants of the device are consistent with the construction of a barrel bomb.

71. This conclusion was based on the following:

- Witnesses confirmed that at least one helicopter flew over Sarmin at the time of the incident.
- Expert and forensic analyses support witness statements that a device or barrel bomb dropped from a helicopter impacted through the ventilation shaft of a house (impact location #2) inhabited at the time by a family of six. The damage was consistent with the kinetic effect of a device or “barrel bomb” falling from high altitude rather than the explosion or detonation of any high explosive.
- Multiple videos of the location #2 show HCFC gas canisters inside the house, with a purple substance on the floor.
- The Government of the Syrian Arab Republic indicated that there had not been any SAAF flights on 16 March 2015, but did not provide any supporting information. However, the Mechanism obtained information from other sources, which corroborate witness statements of SAAF helicopter flights on the date and time of the incident.
- At the time when the incident occurred, the Government of the Syrian Arab Republic had lost control of six airbases, including Taftanaz airbase (Idlib Governorate). The Government informed the Mechanism that 15 helicopters were left behind of at Taftanaz airbase, nine of which were deemed operational.
- The Leadership Panel reviewed all of the information gathered and found no evidence that armed opposition groups in Sarmin, were operating a helicopter at the time and location of the incident.

Annex IX

Binnish, 24 March 2015

Findings of the OPCW Fact-Finding Mission in the Syrian Arab Republic

1. “The FFM team interviewed only one person from Binnish, who was a treating physician at the time of the alleged incident.” (S/2015/908, page 112, paragraph 3.76) On 23 March 2015 at around 1900 hours, the physician was in the field hospital and was informed of the incident through local early warning methods, including hand-held radios. (S/2015/908, page 112, paragraph 3.78)
2. Binnish Field Hospital registered 21 patients related to the incident on 23 March 2014. (S/2015/908, page 112, paragraph 3.79)
3. “In itself, no one source of information or evidence would lend particularly strong weighting as to whether there was an event that had used a toxic chemical as a weapon. However, taken in their entirety, sufficient facts were collected to conclude that incidents in the Syrian Arab Republic likely involved the use of a toxic chemical as a weapon. There is insufficient evidence to come to any firm conclusions as to the identification of the chemical, although there are factors indicating that the chemical probably contained the element chlorine.” (S/2015/908, page 151, paragraph 5.19)

The Mechanism’s investigation

Background

4. Binnish (Idlib Governorate, Idlib District) is located 8 km north-east of Idlib. Sarmin is 6 km to the south and Saraqib 12 km to the south-east. The airfield of Taftanaz, under control of armed opposition groups, is 6 km to the north-east.
5. In the 2004 census, Binnish had about 21,848 inhabitants. A witness stated that in March 2015, Binnish had a population of approximately 5,000 at the time of the incident, as large numbers of people had been displaced from there. In August 2014, a report from the United Nations Office for the Coordination of Humanitarian Affairs indicated 8,500 internally displaced persons (IDPs) in Idlib District.
6. In 2014, Government presence in Idlib consisted of networks of checkpoints and military installations, one running along the M5 motorway between the towns of Ma’arrat al-Numan and Khan Sheikhoun, and the other along the M4 motorway connecting Latakia to the city of Idlib.
7. In the summer of 2014, the Nusrah Front¹ began to clash with many of the armed opposition groups it had been fought alongside against the Government before. Those included Jabhat al-Thuwar and Harakat Hazm. Consequently, the

¹ On 30 May 2013 the Nusrah Front was designated as a terrorist group by the Security Council under resolution 1267 (1999).

Nusrah Front took control of several regions and towns in Idlib Governorate, in addition to some of the weapons and facilities of those armed opposition groups.

8. On 15 December 2014, the Nusrah Front and armed opposition groups, including Ahrar ash-Sham and Jund al-Aqsa, captured the military bases Wadi al-Deif and Al-Hamidiyah, south of Ma'arat al-Nu'man, and thus gained control of the strategic M5 motorway north of Morek as well as several military checkpoints. This cut an important Government access route to Idlib, impeding the ability of the Government of the Syrian Arab Republic to resupply its forces within the city and surrounding area.

9. On 23 March 2015, the Government of the Syrian Arab Republic controlled Idlib city and the military bases near Almastumah, south of Idlib. Pro-Government paramilitary National Defense Forces (NDFs) also controlled the nearby communities of Fouah and Karfaya, north of Binnish.

10. Binnish was largely controlled by the Nusrah Front and Ahrar al-Sham. Failaq al-Sham and other groups were also reportedly present. According to the Government of the Syrian Arab Republic, on 23 March 2015, fighters of the Nusrah Front and armed opposition groups had gathered in the western part of Binnish in preparation for the attack on Idlib city, and were targeting checkpoints of the Syrian Arab Armed Forces (SAAF) towards Idlib with mortar fire, to which Government forces responded with artillery.

11. On 24 March 2015, several factions officially announced the formation of Jaish al-Fatah. This included elements of the Nusrah Front, Ahrar ash-Sham, Jund al-Aqsa, Failaq al-Sham and several others. Jaish al-Fatah commenced operations to seize Idlib city. The city fell to control of Jaish al-Fatah on 28 March 2015.

Narratives

12. The description of events as emerging from the Fact-Finding Mission (FFM) report indicates that on 23 March 2015,² a helicopter dropped a barrel bomb filled with chlorine or chlorine derivative between 1900 and 2000 hours. Chlorine or chlorine derivative was released, affecting 21 people. The Mechanism further investigated the events, and established that the date of the incident was 24 March 2015. Also, two possible impact locations were identified and considered.

13. The Government of the Syrian Arab Republic stated that no incident took place on either of the dates and that armed opposition groups or their supporters staged the use of chlorine as a weapon with the intention to blame the Government.

14. One witness provided hearsay information during an interview about the explosion of a warehouse, in which chemicals were stored. The witness stated that on 22 or 23 March 2015, there had been an explosion around 1930 hours. The witness recounted the testimony of family members. According to them, yellow and white smoke went up to the sky. One family member had breathing difficulties as a result of inhaling something with a distinct smell. The smell was also noticed by another family member. Other people from Binnish told the witness that there had been an explosion in Binnish at a warehouse containing gas cylinders, used to

² FFM referred to the date of the incident as being 23 March 2015, however the Mechanism established the time of the event as 24 March 2015 around 1900 hours.

produce “hell-cannons”. The neighbourhood, in which this warehouse was reportedly located, in addition to the time of the accident, do not match the date established by the Mechanism.

Date and time

15. While the FFM referred to the date of the incident as being 23 March 2015, the Mechanism established the time of the event as 24 March 2015 around 1900 hours.

16. Four witnesses indicated that the incident took place around 1900 hours local time on 24 March 2015. According to one witness, the Binnish hospital started receiving patients around 1915 hours. A second witness stated that a telephone call was received from people in Binnish about the attack at 1900 hours.

17. Several photo and video files have been submitted for independent forensic analysis. For some of the files, the original metadata — including time stamps — had been wiped out and could not be determined.

18. Several individuals posted information concerning this incident on social media websites, starting around 1930 hours on 24 March 2015. Another source provided its assessment to the Mechanism that confirms the same date and time.

19. Two witnesses indicated a different time for the incident on 24 March 2015. One of the two witnesses thought the event might have occurred between 2200 and 2300 hours. Another one had heard military radio communications on a walkie-talkie before the attack and during the treatment of patients at the Binnish hospital.

Weather conditions

20. The sunset on 24 March 2015 was at 1748 hours. At 1900 to 2000 hours, the temperature was 11°C. The wind came from the north-west (320°) and the wind speed declined from 3 m/s to 2 m/s. The humidity was at 95 per cent. It was partly cloudy.

Impact location

Location #1

21. A witness identified the impact point on 24 March 2015 in an agricultural field on the south-eastern side of Binnish, at the coordinates N35.955286° E36.717797°. Another witness described the same impact location of a barrel bomb in the south-eastern area of Binnish in an agricultural field.

22. The location was further corroborated through forensic examination of photographs provided by one of the witnesses. The forensic institute stated that while there was no GPS information in the metadata, comparative image analysis indicates that the pictures were likely taken at the same location.

Location #2

23. A second unexploded barrel bomb has been reported to have landed in a northern neighbourhood by a witness and an independent organization that published this information on open sources. However, there is some discrepancy about the locations, which are over 200 m apart from each other. The witness also indicated that the remnants of this device were buried in a nearby field.

Coordinates of location #2 as provided by different sources

<i>Source</i>	<i>Latitude (decimal)</i>	<i>Longitude (decimal)</i>
Witness	N35.959185°	E36.713626°
Open source	N35.957925°	E36.711673°

24. A report published on an open source referred to the same location and remnants, but indicated that the incident occurred on 23 March 2015 at 1430 hours. A video from that date had also been posted, as well as the recovery of the remnants, which was indicated to have taken place on 26 March 2015.

25. No additional information is available with regard to the second reported barrel bomb. The Mechanism has been unable to find additional or corroborating information on the second impact location.

Munition

26. A witness identified location #1 and described the munition as a barrel bomb, which the witness thought contained six canisters filled with chemicals. The witness estimated the size of the munition as approximately 60 cm in diameter and 150 cm in length. At least one of the canisters remained intact.

27. Pictures of the outer jacket of the munition at location #1 were received from a source. Forensic examination is pending at the time of submission of this report. The same source stated that at least one unexploded canister and a plastic bottle with a dark, crystallized liquid recovered from location #1 was in its possession. There was no evidence of remnants of any other canisters.

28. The chain of custody for the remnants was attested by the source based on the testimony of a witness and a written confirmation by the organization that had collected the samples.

29. The same source also provided a laboratory report on the canister and the content of the plastic bottle. This report indicates that the recovered canister is an HCFC³ gas canister. Although the contents had leaked from a rupture in the bottom, traces of chlorine or a chlorine-like substance had been found on the inside of the canister. The report also concluded that the content of the plastic bottle had been potassium permanganate. The source shared its assessment that the munition consisted of multiple HCFC gas canisters, in addition to several plastic bottles containing potassium permanganate, placed in a large barrel.

30. The two other witnesses who were first responders stated that they recovered remnants of both munitions and that they had buried the remnants out of fear of the chemicals they believed it contained. The Mechanism could not confirm the location where the remnants were allegedly buried.

31. There is no video documentation of the impact location, dismantling and excavation of munition, remnants or crater. Pictures of the place where the remnants were allegedly buried, including of the outer jacket of the munition, have been submitted to the Mechanism on 19 August 2016 and have been submitted for

³ Hydrochlorofluorocarbon.

independent forensic analysis, the results of which are pending at the time of the submission of this report.

Delivery method

32. According to three witnesses, a SAAF helicopter dropped barrel bombs with chemicals. Open sources indicated that there were continuous air operations taking place over Binnish during this period, including on 24 March 2015, which was also confirmed by other sources.

33. The Government of the Syrian Arab Republic informed that no SAAF flight operations took place in the Binnish area on 24 March 2015. The Government did not, however, provide any supporting documentations, such as flight records.

34. Two sources shared their assessment that on 24 March 2015 at 1930 hours, a helicopter departed from Bassel Al-Assad Airport in Latakia in the direction of Idlib. It passed over Binnish at 2105 hours and returned to base at 2107 hours.

35. However, the specific times referred to above do not correlate with the time of the incident 1900 hours, when first affected people sought medical assistance.

Damage and effects

36. Two witnesses had visited the impact location in the agricultural field (location #1) and noted that there was damage to the vegetation manifested by a distinct yellow colour and “dead flora” in the area of the impact. Pictures of the area of damaged foliage were provided to a forensic laboratory which shows that the pictures were taken in Binnish.

37. A satellite imagery analysis indicated that there was no crater visible, but a soil distortion that might be related to an impact. A vegetation index analysis showed that, at this location and two areas in the immediate vicinity, the vegetation was less healthy. This could have been caused by chlorine, other toxic chemicals or other factors. The Mechanism obtained photographs of a site where remnants were buried including an outer jacket, a canister and a plastic bottle, but cannot corroborate this site is also the original impact site.

Medical effects

38. The Binnish hospital registered 21 patients related to the incident. Ten of these were mild cases, ten were moderate cases and one was identified as a severe case. The clinical examination demonstrated that most of the cases were presented with the following symptoms: coughing, difficulty breathing and drowsiness. There were no deaths reported. Two witnesses confirmed the testimony of the treating physician interviewed by the FFM with regard to the extent and type of symptoms of the patients.

39. Two witnesses had indicated that all patients were decontaminated, including washing of the exposed area of skin, outside the hospital, five to 10 m from the emergency room. The physician did not smell chlorine odour emanating from the clothing but was informed of the smell by the patients. The video seems to show patients entering the hospital directly without having been decontaminated.

40. A forensic analysis of the plume effect of the chlorine dispersion on the date and time of the incident indicates that the number of the reported injuries is consistent with the use of chlorine under the prevailing weather conditions. However, this analysis did not take into account the topography and any obstacles, such as houses.

41. The Government of the Syrian Arab Republic shared their assessment of a video retrieved from an open source. The video, titled “Poisonous chlorine gas leads to suffocation in the countryside of Idlib”, shows patients being treated in a health facility. The Government of the Syrian Arab Republic indicated that according to their analysis the video was staged.

42. Independent forensic analysis indicated that the creation date of the file, based on the information in the metadata, was 29 March 2015 at 0330 hours. However, the creation date for this video likely corresponds with the date on which the modified file was created, not the original file.

43. Photographs of the patients taken in the hospital at the time of the incident have been forensically examined, and the conclusion reached is that the pictures were taken in the same place.

44. Whether the scenes in the footage are “staged” cannot be determined by video analysis. It is, however, noted that the patients appear relatively unaffected by the typical symptoms. No red eyes, tearing, paleness, sweating, cyanosis or breathing difficulties can be observed from the footage. The patients interviewed in the video show little or no signs of having been exposed to a toxic chemical.

45. The structure and extent of video material on the Binnish case shows only the activity at the hospital.

The Leadership Panel’s Assessment

46. The Leadership Panel examined the available information regarding the incident in Binnish on 24 March 2015 and was able to confirm the existence of a canister with traces of chlorine or a chlorine-like substance. It has further received additional information in relation to remnants of the outer jacket of a device that is consistent with the construction of a barrel bomb.

47. The Leadership Panel was close to having sufficient information to reach a conclusion on the actors involved on the basis of the chain of custody on the remnants found and the overall findings of the FFM. However, there are inconsistencies in the case, including the link between the remnants and the impact site(s), accounts of the explosion and affected individuals, which are being further investigated.

48. This assessment was based on the following:

- According to three witnesses, a SAAF helicopter dropped a device or “barrel bomb” with chemicals at night over Binnish. However, there are inconsistencies in relation to the date and time of the incident, the impact location(s) and the description of the exposure to toxic chemicals suffered by the local population.

- Despite the inconsistencies and scarcity of information surrounding this case the Mechanism has been able to corroborate some key elements such as the remnants recovered by local respondents from an agricultural field in Binnish which were subsequently recorded and documented. The remnants found at location #1, i.e. the outer jacket, a canister and a plastic bottle, are consistent with the construction of a barrel bomb. The canister and the content of the plastic bottle were analysed by a laboratory which found traces of chlorine or a chlorine-like substance in the canister. The laboratory also concluded that the content of the plastic bottle had been potassium permanganate. The chain of custody for these remnants was established.
- The Mechanism could not obtain any information concerning the explosion of the device. Nevertheless it has received information on the impact location, which is being forensically analysed.

Annex X

Marea, 21 August 2015

Findings of the OPCW Fact-Finding Mission in the Syrian Arab Republic

1. “The team can conclude [...] with the utmost confidence that at least two people were exposed to sulfur mustard [...] and] it is very likely that the effects of sulfur mustard resulted in the death of an infant.” (S/2015/908, page 215, paragraph 4.6)

The Mechanism’s investigation

Background

2. Marea (Aleppo Governorate, Azaz District), is located 35 km north-east of Aleppo city and 18 km south of the Bab al-Salam border crossing to Turkey. In the 2004 census, Marea had a population of close to 17,000 in the city and 40,000 in the Marea sub-district.

3. In July 2015, two coalitions of armed opposition groups (Fatah Halab and Ansar al-Sharia) launched a major offensive against Government forces in western Aleppo city, capturing the Scientific Research Centre to the west of the Jamiyat al-Zahra frontline.

4. The Islamic State in Iraq and the Levant (ISIL),¹ which controlled territory to the east, north-east and south-east of Aleppo city, took advantage of the armed opposition groups’ engagement with Government forces to advance westward towards Marea. This was of strategic importance due to Marea’s location near key routes through Azaz and the Bab al-Salam border crossing.

5. By August 2015, Ahrar al-Sham, Failaq Al-Sham and other Free Syrian Army-affiliated groups had moved reinforcements to Marea to counter ISIL’s advance towards the west. Heavy clashes were reported in Tilalyan on the North and Umm Hawsh in the south. However, by 26 August, ISIL had circled Marea by three sides, effectively besieging the city.

6. Marea had been a traditional stronghold of armed opposition groups, such as Liwa al-Tawhid, whose leadership originated there. Other armed opposition groups present in August 2015 included Jabhat al-Shamiyah, its faction Thuwar al-Sham, Failaq al-Sham, Ahrar al-Sham, the 101st Infantry Brigade, the Firqa 13 and Jaish al-Thuwar. The Nusrah Front was present in and around Marea, too.

7. The Al-Houria Hospital in Marea is supported by a non-governmental organization. It provides mainly emergency health care and transfers severe cases to Tal Rifaat Hospital.

¹ On 30 May 2013, Islamic State in Iraq and the Levant (ISIL) and the Nusrah Front were designated as terrorist groups by the Security Council under resolution 1267 (1999).

Narrative

8. The Fact-Finding Mission (FFM) stated that on 21 August 2015 around 1000 to 1100 hours, over the course of approximately one hour and a half, Marea was bombarded by around 50 artillery projectiles. (S/2015/908, page 201, paragraph 3.7)

9. Several witnesses, other sources and independent entities supported this description of the events. Accordingly, on 21 August 2015 over 50 artillery projectiles, several of which were filled with sulfur mustard, were fired towards Marea from the east or south-east. On that and the following days a number of people reported to the hospital with symptoms related to exposure to sulfur mustard.

10. The Mechanism considered an alternative hypothesis, in which an accident occurred within Marea. That it could either have been an operational incident, for example, while trying to fill munitions with sulfur mustard, or in form of a leakage due to the detonation of a conventional munition. However, no information was found to substantiate this theory, which would also not explain the exposures of the victims.

Date and time

11. Two eyewitnesses stated that Marea was subjected to artillery fire on 21 August 2015. Five other sources stated this occurred on 21 August 2015 between 0930 and 1130 hours, Marea. The Government of the Syrian Arab Republic shared its assessment that the shelling started at 0930 hours.

Weather conditions

12. On 21 August 2015, between 0900 and 1100 hours, the wind came from the west (280°) at a speed of 5 m/s. The temperature increased from 27°C to 32°C and the relative humidity decreased from 90 per cent at 0900 hours to 83 per cent at 1100 hours.

Impact location

Location #1

13. One artillery shell hit a house “close to the vegetable market” in the south-east of Marea. Two witnesses gave the address as Mouabbad Street.

Location #2

14. A different artillery shell fell in the courtyard of a house. An individual who disposed of the shell was exposed to a dark liquid that leaked from that shell.

Other locations

15. A witness mentioned several additional impact points of artillery shells across the city, with some landing close to the water reservoir. For those shells, the Mechanism does not have any indications of whether they were filled with sulfur mustard.

16. A map provided by an independent organization shows multiple impact sites of artillery shells equally distributed throughout the town. Among those indicated impact points, it is unclear which shells were filled with sulfur mustard.

Munition

Location #1

17. Some witnesses said that their house “had been shelled”, but did not provide any further information on the exact type of the delivery method or munition.

Location #2

18. A witness provided pictures of artillery shells, stating that they were 130 mm shells. The witness described that the shell created a small hole in a wall and removed a small piece (10-16 cm) of tarmac.

Location #3

19. A witness said that an unexploded artillery shell landed on a roof of a house in the south-east part of Marea.

General

20. Witnesses stated that on 21 August 2015 over 50 artillery shells fell all over the town of Marea. One witness stated that the artillery shelling lasted over one hour with a frequency of one artillery shell per minute. Several open sources also refer to the artillery shelling of Marea on 21 August.

21. Four other sources stated that the munition used in all these locations were 130 mm artillery shells. These artillery shells are thought to be easily repurposed and filled with different payloads.

22. The Mechanism received more than 20 photos and 61 videos of the munition used in Marea from different sources, witnesses and entities. Some of these photos indicate that the agent release method of the munition was improvised and unsophisticated. Forensic examination of the pictures with regard to the munition type was inconclusive. The pictures of the munition show that they had been moved from the impact point to the location where the pictures and videos were taken.

Delivery method

23. In relation to 130 mm artillery shells, the Government of the Syrian Arab Republic stated that they had not abandoned nor did any armed opposition group seize 130 mm towed field guns, which were used to launch these munitions, during their retreat from this area in December 2012. The Government stated, however, that ISIL may have had access to such weapons in Northern Iraq, which was under ISIL control. Open sources information shows pictures of ISIL having 130 artillery shells and towed-field guns.

24. A witness stated to have seen the launching of artillery shells from a roof. According to this witness, the shelling originated from either Tel Malid (about 5 km in the south-east) or from Al-Sayed Ali, a few hundred metres south of Tel Malid.

Another witness stated that ISIL had launched the shells from Hawar al-Nahr (about 5 km in the north-east-east) or Ahtemelat (about 10 km in the north-north-east).

25. Several sources, including the Syrian Arab Republic, stated that the shells came from the east.

26. The Mechanism attempted to corroborate the direction which the artillery shells came from and requested a forensic institute to conduct imagery analysis, including comparison with satellite imagery. However, this analysis did not yield any tangible results. The forensic institute confirmed that all of the videos and photos analysed had not been tampered with. The Mechanism could not establish a direct link between these images and exposure of people.

27. The Mechanism requested additional satellite imagery of the area around Marea to identify a potential source. Some imagery was received on 19 August and analysis is ongoing.

Damage and effects

28. The videos from one of the impact locations show a lot of destruction and damage on the houses. No crater can be seen in any of the videos. One witness described that the artillery shell created a small hole in a wall of a house and removed a small piece (10-16 cm) of tarmac from the wall.

Medical effects

29. A family of four persons who were residing in the house at location #1 have been exposed to sulfur mustard. The exposure of two of these family members was confirmed by the FFM. In addition, a witness stated that a family of five was exposed.

30. One individual was exposed while removing an artillery shell. There is a video of this individual at the hospital, in which clinical symptoms such as blisters on the left leg can be seen. The person stated that when carrying a shell in order to bury it in the ground and a liquid leaked out of the shell over his/her leg causing the blisters. A witness confirmed the identity of the injured person that appeared in the video. Forensic analysis did not yield any further information.

31. Different sources report up to 85 people seeking medical assistance with injuries and symptoms related to sulfur mustard exposure over the course of the next four days. The number of injured have been cross-checked with reports from several sources, who indicated numbers as “at least 10”, “50” and “up to 85” casualties. One witness said that 23 people sought medical attention on 21 August 2015, and more than 60 over the next few days.

32. The medical effects described by the FFM were consistent with witness statements and reports of independent organizations.

33. In order to find more information on the munition and delivery method, the Mechanism undertook several activities to identify additional victims. However, no additional victims have been found to date.

Further information

34. Sulfur mustard is a colourless, viscous liquid, odourless in its distilled, pure form. However, if not stabilized properly, it can easily polymerize resulting in a yellow-brown liquid of increasing density with an odour resembling mustard plants, garlic or horseradish.

35. Several witnesses, entities and other sources referred to the bad smell in the area (e.g., smell of garlic, rotten eggs, irritating, very bad). Several pictures from different sources show a dark viscous liquid. The examination of the pictures by a forensic institute could neither confirm nor exclude that the liquid on the photo is sulfur mustard.

36. Multiple sources suggested that the sulfur mustard in question was undistilled and had been generated through the Levinstein process. According to them, the bad smell (rotten eggs) and colour of the substance (dark green/blue) were consistent with sulfur mustard used by ISIL in other incidents, including in a neighbouring State. The olfactory observation of a rotten smell supports the assessment that the sulfur mustard may have been produced through the Levinstein process. The smell is stronger when undistilled, similar to that of rotten eggs, due to impurities of such reactions.

37. Some sources provided information that indicated that ISIL had the capacity to produce sulfur mustard through the Levinstein chemical reaction process.

38. The Organisation for the Prohibition of Chemical Weapons (OPCW) confirmed that the sulfur mustard from the Syrian Arab Republic did not contain impurities such as polysulphides, meaning that a different process was used by the Government. The OPCW also reported that the sulfur mustard used by ISIL in northern Iraq on several occasions in 2015 and 2016 was produced through the Levinstein process.

39. The Mechanism requested clothing from victims and environmental or certain biomedical samples. However, none were made available to the Mechanism for further analysis, despite repeated requests.

40. There is not sufficient information available to draw conclusions on the origin of the sulfur mustard used during this incident.

The Leadership Panel's assessment

41. The Leadership Panel examined the existing information regarding the incident in Marea on 21 August 2015 and determined that there is sufficient information to conclude that the Islamic State of Iraq and the Levant (ISIL) was the only entity with the ability, capability, motive and the means to use sulfur mustard in Marea on 21 August 2015.

42. This conclusion was based on the following:

- Marea had been a traditional stronghold of armed opposition groups, which were fighting against Government forces. On 21 August 2015, ISIL advanced westward towards Marea.

- Several witnesses, as well as a number of other sources provided information that Marea was bombarded by around 50 artillery shells, several of which were filled with sulfur mustard, from the east or south-east, an area under the control of ISIL.
 - On that and the following days a number of people reported to the hospital with symptoms related to exposure to sulfur mustard.
 - A large number of photos and videos of the munition used in Marea were received and analysed by the Mechanism. Four sources stated that the munition used was 130 mm artillery shells. The photos and videos of the munition are consistent in relation to the release of a dark viscous liquid from the artillery shell.
-
