Commission on Narcotic Drugs

Forty-third session

Vienna, 6-15 March 2000

Item 5 (b) (iii) of the provisional agenda*

**Illicit drug traffic and supply: follow-up to
the twentieth special session: Action Plan on
International Cooperation on the Eradication
of Illicit Drug Crops and on Alternative Development**

Follow-up to the Action Plan on International Cooperation on the Eradication of Illicit Drug Crops and on Alternative Development

Report of the Executive Director

I. Background

1. The General Assembly, at its twentieth special session, adopted a Political Declaration (resolution S-20/2, annex) and resolutions on several related matters, including the Action Plan on International Cooperation on the Eradication of Illicit Drug Crops and on Alternative Development (resolution S-20/4 E). In its resolution 53/115, on international cooperation against the world drug problem, the Assembly requested the Executive Director of the United Nations International Drug Control Programme (UNDCP) to report to the Commission on Narcotic Drugs on the follow-up to the Action Plan. The report was submitted to the Commission at its forty-second session in document E/CN.7/1999/3. In its resolution 54/132, the Assembly again requested the Executive Director of UNDCP to report to the Commission, at its forty-third session, on the follow-up to

the Action Plan. The second report of the Executive Director, which covers developments since 1998, is contained in the present document.

II. Follow-up to the Action Plan by the United Nations International Drug Control Programme

A. Global level

2. As a direct follow-up to the Action Plan, UNDCP developed a four-year global programme for alternative development, costed at 1.5 million United States dollars (\$). The main aims of the global programme are to develop and systematize lessons learned and best practices arising from the wide range of alternative

* E/CN.7/2000/1.

development projects carried out by UNDCP around the world, and to improve the analysis and dissemination of project results. A technical repository of that nature will in future prove invaluable to Governments and UNDCP in the design of new programmes and projects, the identification of project indicators and benchmarks and the development of training programmes, evaluation missions and publicity material for substantive advocacy and fund-raising.

3. In April 1999, the global programme started to monitor and track the progress made in areas such as gender mainstreaming in rural development; credit schemes in illicit crop areas; development of agro-industries; income diversification; the role of community organizations; sound project monitoring and management at local and national levels. From October 1998 to January 2000, an assessment of gender mainstreaming activities in alternative development was carried out. The result of the assessment is contained in a UNDCP document entitled "Guidelines on best practices for gender mainstreaming in alternative development". The guidelines were finalized at a workshop of experts and constitute a practical review of existing knowledge and experiences on the gender situation in geographic areas affected by illicit cultivation of narcotic crops. The guidelines will be used, in the first instance, for training purposes and for project development exercises.

4. Another major development during the period under review was the setting up of an illicit crops monitoring programme in response to the Action Plan and to Commission resolution 42/3, entitled "Monitoring and verification of illicit cultivation".

5. The illicit crops monitoring programme currently focuses its work on the six countries in which the bulk of world illicit crop cultivation occurs, namely, Afghanistan, Bolivia, Colombia, the Lao People's Democratic Republic, Myanmar and Peru. Under a partnership arrangement with the European Space Agency, UNDCP carried out several assessment and programming missions from June to October 1999 in the six priority countries to identify their technical assistance needs for the establishment of national monitoring mechanisms. UNDCP also elaborated, with relevant partners, a common methodology related to the monitoring of illicit crops, bringing into play a combination of applied technologies, such as satellite imagery, ground surveys and aerial surveys. The results of the missions conducted in the six priority countries and the implementation of the common methodology are under constant review by a panel of internationally recognized

experts in the field of remote sensing and monitoring. The first panel of experts met at UNDCP headquarters from 16 to 17 December 1999.

6. UNDCP has drawn up six national projects, one for each priority country. Some of the projects are under way, while others are subject to the availability of funding. The illicit crops monitoring programme has assisted in several new initiatives, including the following: a national ground survey in Afghanistan, using satellite imagery in four pilot districts to improve the quality of traditional surveys; a national survey in Colombia using satellite imagery; and a national ground survey in the Lao People's Democratic Republic, including preparatory work for remote sensing. Technical advice was offered to Bolivia to develop a national system to monitor illicit cultivation in Chapare and the Yungas region. In Peru, advice was provided to complement the existing national aerial survey capacities with satellite images. In Myanmar, preparatory work started on the use of satellite imagery in the UNDCP alternative development project area, as a first step towards eventual national coverage.

7. The national systems being promoted are expected to contribute significantly to the establishment and reinforcement of an international network for the monitoring of illicit crops, in line with Commission resolution 42/3. Equally important, the systems will become an essential tool for planning, monitoring and measuring the results of alternative development projects funded by Governments, UNDCP and other donors.

B. Regional and national level

8. In Pakistan, UNDCP is continuing its alternative development activities in the Dir district of the North-West Frontier Province. Following successful eradication efforts by the Government of Pakistan, only 0.1 hectares of opium poppy were harvested in the Dir district in 1999. Accordingly, the drug control objective of the second phase of the UNDCP Dir district development project, under way since 1994, has been mostly achieved one full year prior to its completion. In order to sustain the elimination of the opium poppy crop, planning has begun for a 5- to 10-year consolidation programme, involving bilateral and multilateral assistance.

9. In Afghanistan, the UNDCP alternative development pilot project continues to be implemented in four target districts of Nangarhar and Qandahar provinces. The

activities carried out under the project aim at creating alternative sources of livelihood, increasing on- and off-farm income opportunities and improving social services and community amenities. Through participatory planning, the beneficiaries in the target districts are given the opportunity to identify and prioritize their needs with a view to their inclusion in the package of development assistance. Taking into account the limitations on action inside Afghanistan, because of the situation in the country which has led to the relocation of the international staff to Islamabad, the project mainly focuses on learning lessons in order to develop methodologies appropriate to the prevailing circumstances.

10. The project will be incorporated into a new integrated drug control programme for Afghanistan that was elaborated in 1999. The new programme will strengthen UNDCP capacity to work within the common programming approach for Afghanistan, while continuing the ongoing pilot projects. Common programming is a joint initiative by all United Nations agencies and non-governmental organizations active in Afghanistan, and aims at enhancing the coherence and effectiveness of all assistance to the country. By providing guidance to agencies that work in opium-poppy-growing areas, UNDCP will be in a position to introduce the drug control objective into wider development programmes.

11. In Myanmar, the inception phase of a five-year alternative development project in the southern Wa region, costed at \$15.5 million, was under full implementation in 1999. The first phase will be subject to evaluation in February/March 2000. The project is targeting a major opium-producing area of the Wa region near the border with China covering about 200,000 hectares, and involving 260 villages and 6,250 households. With the objective of reducing illicit cultivation of opium by 80 per cent over the project period, the project is using a sustainable community-based approach for the reduction and eventual elimination of the opium-based economy. A key component of the project is the development of a system to assess the amount of opium produced in the Wa region in order to monitor the progress of the project and ensure that its activities achieve the desired results. In 1999, baseline ground and aerial surveys for opium poppy cultivation were completed. Poppy cultivation, land use and socio-economic data were made available. Most of the project component leaders were recruited, the first group of target villages was selected, permanent project facilities were constructed and essential equipment was procured. UNDCP also provided support to opium eradication

programmes initiated by local communities in the northern Wa and Kokang regions, providing irrigation systems, high-yielding rice varieties and improved access to roads.

12. In the Lao People's Democratic Republic, new alternative development projects targeting priority areas in the provinces of Bokeo, Houa Phan, Oudomxai and Xieng Khoang started operations in 1999, with a total budget of \$7.6 million. Activities are implemented in close cooperation with other international bodies, such as the United Nations Development Programme, the International Fund for Agricultural Development and the Asian Development Bank. In May 1999, the President of the Lao People's Democratic Republic and UNDCP agreed to launch a six-year programme to eliminate opium poppy cultivation. The programme, jointly developed by UNDCP and the Lao National Commission for Drug Control and Supervision, will target 15 priority districts in eight northern provinces. The multisectoral approach will require \$80 million for new drug control projects and for ongoing and new projects with complementary objectives in the field of poverty alleviation. Estimated programme costs include \$60 million for alternative development, 25 per cent of which is earmarked for roadworks supported by the Government in the form of soft loans. UNDCP has begun project formulation under the programme, starting with the highest priority districts in Phongsali province. The programme will involve active cooperation between bilateral donors and regional and international institutions.

13. In Viet Nam, during the period under review, UNDCP supported the \$4 million Ky Son alternative development pilot project (first phase) in the province of Nghe An, bordering the Lao People's Democratic Republic and covering 202,500 hectares, with a target population of 38,000. The project is designed to serve as a model to be replicated in, and adapted to, other poppy cultivation areas. The strict government enforcement of the ban on poppy cultivation has successfully reduced illicit poppy cultivation by more than 90 per cent in the project area, which, at the start of the project, produced more opium than any other district in the country. The village-based initiatives and activities under the project have resulted in improved socio-economic conditions and the introduction of various alternative income-generating activities for villagers. However, new income-generating activities are not yet fully sustainable. Accordingly, UNDCP assisted in the formulation of the second phase of the project to start in 2000, in line with the recommendations of the project evaluation.

14. During September and October 1998, the Governments of Bolivia, Colombia and Peru prepared three individual business plans for the elimination of illicit drug crops through alternative development. The objectives and overarching principles of the three business plans were presented to the Commission on Narcotic Drugs, at its forty-second session, in document E/CN.7/1999/3.

15. The three business plans comprise 18 projects at an aggregate cost of \$170.2 million, including three projects in Bolivia (\$64.2 million), seven projects in Colombia (\$60 million) and eight projects in Peru (\$46 million). All projects are grounded in the national alternative development plans of the respective countries, and are for execution during the period 1998-2003. Nearly 20 per cent, or \$31 million, has been raised so far for the business plans, and this has enabled UNDCP to start 12 of the 18 projects. Fund-raising efforts are under way to identify donors for the remaining \$139 million needed for full execution of the business plans by 2003.

16. During the period under review, the agroforestry programme in Bolivia was enlarged from a \$3 million budget in 1998 to a total budget of \$9.2 million, including a \$1.2 million cost-sharing contribution from the Government of Bolivia. Part of the new funding will deal with illicit coca cultivation in the Yungas, a region where restricted coca cultivation for traditional purposes is permitted by Bolivian law, but which is increasingly being used also for illicit cultivation. The agroforestry programme works directly with over 3,500 beneficiaries, organized as shareholders in forest management units, and supports the processing and marketing of forestry products, including timber and cash crops such as palm heart, oranges, passion fruit, rubber and bananas. Farmers are already deriving \$1,400 per year in regular income under the project. Equally important, the programme assists local and national authorities with the rehabilitation of soils previously degraded by coca cultivation, and supports environmental protection legislation and the introduction of sound national park management practices and the promotion of ecotourism. An external and independent project evaluation carried out in June 1999 confirmed that the project approach has led to a reduction of 1,591 hectares of coca cultivation in the area.

17. A second business plan project started with a preparatory assistance phase to introduce vocational training and microenterprises for about 7,000 young people in the Chapare region of Bolivia. The project assesses the

training needs and existing vocational training capacities as well as the absorption capacity of the labour market in areas affected by illicit cultivation of the coca bush. The third business plan project, started in September 1999, introduced an integrated system of national planning, management and monitoring for alternative development. The project also promotes better coordination of domestic and external resources.

18. Under the Peruvian business plan, UNDCP commitments rose from \$4.2 million in early 1999 to currently \$7.6 million, covering four major coca-growing areas. The three new projects in the Lower Huallaga, the Pichis-Palcazu valleys (known as the Selva Central) and the Inambari and Tambopata valleys (known as the Puno Selva) build substantially on the experience of the ongoing project in the Apurimac valley, in particular with regard to improvements in traditional crops such as coffee and cacao, and on business-oriented management practices for agro-industrial enterprises, including the production of palm oil and palm heart. In the Selva Central, UNDCP also supports improved cattle-breeding. Two palm-oil plants and rural infrastructure, including feeder roads, were rehabilitated under the project.

19. For the first time, the Government of Peru contributed cost-sharing of \$0.6 million to UNDCP projects. Project formulations were carried out for business plan projects in Palmapampa-Santa Rosa and in the Monzon-Tingo Maria area, and projects activities are ready to start subject to funding. Under two other business plan projects, UNDCP is upgrading the technical, managerial and fund-raising capacities of the national drug control commission (Comisión de la Lucha contra el Consumo de Drogas (CONTRADROGAS)), as well as the capacity of the Government to undertake surveys for the monitoring of illicit crops.

20. In Colombia, UNDCP continued to assist the Office of the National Alternative Development Plan at the national, regional and municipal levels with the formulation of projects for seven regions earmarked for alternative development. Emphasis was placed on ensuring that the projects are integrated into the regional and municipal development plans. That process has governed seven projects to date. Despite prevailing violence in the PLANTE project areas, UNDCP continued to support agricultural extension services reaching 2,335 farm families in the departments of Bolívar, Caqueta, Cauca, Guaviare, Meta, Nariño and Putumayo. In the second half of 1999, a second business plan project, "Alternative

development for Meta-Caqueta”, started to provide assistance to farmers in the cultivation of legal crops and cattle-breeding.

21. UNDCP also supported the Government in the formulation of four additional business plan projects worth \$30 million for about 5,000 farm families in areas of coca and opium poppy cultivation. The pace of work in Colombia is directly dependent on progress made by the Government in addressing the armed conflict in the country.

22. In Colombia and Peru, UNDCP assists Governments with the establishment of national systems for monitoring illicit drug crops. Those systems will not only allow crop measurement, but also provide data on eradication efforts in Colombia and on progress in alternative development in both countries. In Peru, the first phase of the coca monitoring project is in full operation, with the aim of producing detailed maps of 11 coca-growing areas based on a combined interpretation of air photographs, satellite images and ground surveys. The aerial survey has been concluded for six coca-growing areas. In Colombia, the monitoring project started in September 1999. It is designed as a bridging project that prolongs the Colombian pilot phase of a first satellite survey in Guaviare and parts of Vaupes and Vichada, and that will be linked to a future land-use mapping project to be funded by the European Commission. Both the Colombian and Peruvian projects feed into the UNDCP integrated crop monitoring programme.
