**Commission on Narcotic Drugs**

Forty-fourth session

Vienna, 20-29 March 2001

Item 6 (a) of the provisional agenda\*

**Illicit drug traffic and supply: world situation with regard  
to drug trafficking and reports of subsidiary bodies of the  
Commission**

**World situation with regard to illicit drug trafficking and  
reports of subsidiary bodies of the Commission on  
Narcotic Drugs**

**Report of the Secretariat**

*Summary*

The present report provides an overview of global trends and patterns in illicit drug production and trafficking and of the action taken by the subsidiary bodies of the Commission on Narcotic Drugs in 2000.

The global supply of heroin declined in 2000, mainly because of the decline in opium production in Afghanistan. The country was also responsible for the production peak in 1999, though statistics for that year indicated that the overproduction was not passed on to western Europe, the main consumer region, where prices and seizures of heroin were stable in many countries. Enormous seizure increases were, however, noted in countries surrounding Afghanistan. In east and south-east Asia, China has emerged as an important conduit for opiate trafficking.

It is estimated that cocaine production continues at more or less stable levels, with Bolivia and Peru indicating further decreases (though the decreases are assumed to be rather minimal in Peru in 2000), while estimates for Colombia reflect further increases. In 1999, seizures of cocaine were rising in both major consumer regions, the United States of America and western Europe.

Production and trafficking of amphetamine-type stimulants, mainly methamphetamine, are rising rapidly in east and south-east Asia. In North America, the trafficking of methamphetamine is continuing but the main concern is currently related to Ecstasy-type substances, imported in large quantities from western Europe. Trafficking in amphetamine-type stimulants within western Europe seems to have stabilized.

## I. Introduction

1. The present report provides an overview of the latest trends in illicit drug production and trafficking at the global and regional levels, and summarizes information received from Governments in the annual reports questionnaires. The statistics and analyses are presented by drug type and include information on the latest trends in illicit cultivation, production and trafficking in opiates and coca; global opiate and coca interception rates and availability of potential heroin and cocaine to the world markets; a brief overview of the latest cannabis trafficking trends; and a summary of illicit manufacturing and trafficking trends of amphetamine-type stimulants (mainly amphetamine, methamphetamine and Ecstasy-type substances).

2. The primary source of information used for the statistics and analyses presented in this document is the annual reports questionnaire, part III (illicit traffic), submitted by Governments to the United Nations International Drug Control Programme (UNDCP). Particular focus is given to annual reports questionnaires for 1999, as received by 7 December 2000. A total of 108 questionnaires were received by that date. A similar number was received in previous years, however, the number is slightly lower than last year. For the analysis of trends, annual reports questionnaires for previous years were used as the main source of data.

3. In addition, some information included in the present report has been drawn from reports on individual significant seizure cases, which have been furnished by some Governments to UNDCP. Finally, other governmental reports received by UNDCP or submitted to the Subcommission on Illicit Drug Traffic and Related Matters in the Near and Middle East or Meetings of the Heads of National Drug Law Enforcement Agencies (HONLEAs) have been used as a source of information.

4. In the absence of annual reports questionnaires or in cases where insufficient information was received, the following sources were used to supplement data gaps: the International Criminal Police Organization (ICPO-Interpol), the Customs Cooperation Council (known as the World Customs Organization), the International Narcotics Control Board and the Inter-American Drug Abuse Control Commission.

5. Despite increased information received from Governments, it remains difficult to provide detailed analyses, owing to the inherent difficulties in a number of indicators used to measure drug production and trafficking. With regard to cultivation and production of plant-based drugs, data are mostly based on estimates, as no exact information is available.

6. As for trafficking trends, seizures of drugs are used as the most important indicator. Seizures are, however, indirect rather than direct indicators and measure not only trafficking trends, but also the level and effectiveness of law enforcement capacities in each country. Nevertheless, the congruence of trends in production and seizures in the cases of both opiates and coca (for example, see figure 8) supports their statistical worth.

7. Finally, statistics on detection of clandestine laboratories, which are used to measure manufacturing activities, also have limitations. Statistics on the number and type of laboratories detected per country provide information on the location of manufacturing activities and types of drugs produced, but do not provide any indication regarding the volume of drug production, as the capacity often remains unknown. Nevertheless, drug seizures made in the context of detection of clandestine laboratories represent a useful tool for the early identification of trends with regard to the exact type of drugs produced, the precursors used and the synthesis methods applied. (By comparison, drug seizures at the street level, for example, often do not provide exact information concerning the type of drug seized. This is particularly common in the case of synthetic drugs; for example, in the differentiation between different amphetamine-type stimulants.)

## II. Summary of worldwide trends in illicit traffic

### Opiates

8. Global production of opium has declined from more than 5,700 tons in 1999 to an estimated 4,700 tons in 2000. This trend is due mainly to a decrease in production in Afghanistan, which now accounts for about 69 per cent of the global production, as compared with 79 per cent in 1999. Opium production in Myanmar accounted for 23 per cent of

the global production level in 2000. Other countries in Asia together continue to account for less than 5 per cent and Latin America for about 3 per cent.

9. In 1999, the potential heroin production was more than 570 tons and the total amount of opiates seized amounted to almost 85 tons (in heroin equivalent), an interception rate of 15 per cent. Thus, the potential availability of heroin to the world market in 1999 was estimated at almost 500 tons. By comparison, the potential heroin availability in 1998 was about 360 tons. Less than 400 tons of potential heroin are assumed to have also been available in 2000 (taking an average opiate seizure level).

10. Heroin and opium seizures increased at the global level in 1999, along with the rise in opium production during that year. Seizures of opium amounted to 240 tons in 1999, the second highest level ever recorded and a 36 per cent increase over 1998. More than 80 per cent of the global opium seizure volume continues to be recorded in the Islamic Republic of Iran, the remainder being seized in other countries within the producer regions. Global heroin seizures reached an unprecedented level of over 35 tons in 1999. Seizures have been steadily rising over the last two decades, mirroring the increasing trend in opium production over that period. South-west Asia and western Europe continue to record the bulk of heroin interceptions, both subregions accounting for about 30 per cent of the global seizure volume in 1999. The east and south-east Asian subregion accounted for about 20 per cent and central Asia, eastern Europe, south Asia and North America for less than 5 per cent each.

11. The increase in heroin seizures occurred mainly in south-west Asia, in particular in the Islamic Republic of Iran and other countries surrounding Afghanistan. Heroin seizures as well as prices were, however, relatively stable in western Europe in 1999, an indication that the 1999 opium production peak in Afghanistan was not passed on to its major consumer region during that year.

12. In addition to south-west Asia, opiate seizures also increased in central Asia and the Russian Federation. Turkmenistan and Uzbekistan reported relatively large opium seizures in 1999 and Tajikistan recorded a large increase in heroin interceptions in 1999 and 2000, with seizure levels now being above

those of many western European countries and the United States of America.

13. Seizures statistics indicate that opiates produced in Afghanistan and destined for Europe are increasingly trafficked along the western and northern routes, crossing the Islamic Republic of Iran and central Asian republics. Turkey continues to be used as a transit country and for conversion of morphine into heroin hydrochloride, but increased quantities of heroin (of possibly lower quality) are now directed northwards of Afghanistan, partly via the Islamic Republic of Iran. Increases have been less significant along the southern route via Pakistan, which continues to be used as a trans-shipment point for heroin trafficking to Europe and North America, often via countries in Africa or the Near and Middle East.

14. Heroin seizures decreased in south-east Asia in 1999, presumably owing to a decline in opium production in the region during that year (mainly in Myanmar). China emerged as an important conduit for heroin trafficking, with heroin seizures accounting for 80 per cent of the total volume seized in east and south-east Asia in recent years. In 1999, along with the decline in opium production in the region, heroin seizures in China reflected a decline from the very high 1998 peak.

15. Heroin seizures in the United States declined slightly for the first time in many years.

### Coca

16. Global illicit coca production appears to have been more or less stable in 2000 compared to previous years, with an estimated 800 tons of potential cocaine produced. Throughout the 1990s, potential annual cocaine manufacture is assessed to have fluctuated between roughly 800 and 900 tons globally. The stabilization is a result of decreasing trends in Peru and Bolivia in recent years, which have been offset by increases in Colombia. Estimates indicate that in 2000 75 per cent of the cocaine available worldwide originated from Colombia, while Peru accounted for 21 per cent and Bolivia 4 per cent.

17. In 2000, Peru noted a slight decrease in the total area under coca cultivation, which covered an estimated 37,200 hectares, down from the level of approximately 38,700 hectares in 1999. This represents a 70 per cent decrease in comparison with the early

1990s. Illicit coca cultivation in Bolivia has also declined over recent years and is assumed to have decreased by another 50 per cent in 2000, now covering an estimated area of 5,000 hectares. Colombia reported an increase from a total of 45,000 hectares in 1995 to over 100,000 hectares in 1999.

18. With an estimated total of roughly 800 tons of potential cocaine produced in 1999 and a total of about 360 tons of cocaine seized worldwide during that year, the potential availability of the drug for global consumer markets would be estimated at 440 tons. The estimated interception rate of 45 per cent may be unrealistically high, however, as some estimates put global cocaine consumption at 500 or even above 600 tons, indicating that the level of global coca production may be higher than currently estimated.

19. Global seizures of cocaine increased significantly in 1998, after a more or less stable period during previous years. In 1999, seizures declined slightly from the 1998 peak but remained above the level of previous years. Interceptions in the Americas account for about 90 per cent of the cocaine seizures worldwide, the remainder being seized in western Europe.

20. The United States continues to record the largest cocaine seizure volume. Interceptions, which had appeared to level off in the early 1990s to between 120 and 130 tons, have shown a slightly increasing trend in recent years, reaching more than 132 tons in 1999.

21. The large cocaine seizure volume at the global level in 1998 and, to a lesser extent, in 1999 was also related to Colombia, where interceptions rose from an average level of 50 tons between 1990 and 1997 to over 100 tons in 1998 and 64 tons in 1999. In 1999, the country also reported a large seizure of liquid cocaine. Colombia and the United States together account for more than 50 per cent of the global seizure volume.

22. Cocaine seizures in all other countries are at a much lower level. Trends in Bolivia continue to reflect a decrease, while those in Peru have risen again over the last three years. This may confirm recent information received with respect to reactivation of some abandoned cultivation areas in Peru. Significant increases in cocaine seizure were noted in Ecuador and Venezuela in 1999, both of which border Colombia. Cocaine interceptions decreased in Central America, as well as the Caribbean, in 1999, while seizures in

western Europe increased, reaching 42 tons in 1999, the highest level ever recorded.

### **Cannabis**

23. Global cannabis herb seizures increased significantly in 1999, reaching almost 4,000 tons, an increase of 35 per cent over 1998 and 46 per cent over the average level recorded during the 1990s. Increases were mainly related to the traditional producer and consumer areas in the Americas, which account for 80 per cent of the global seizure volume. Both Mexico and the United States, which regularly account for the highest seizure volumes, reached seizure records in 1999. Changes in cannabis herb seizures in other regions were less significant, with Africa accounting for more than 10 per cent of cannabis herb seized worldwide and Europe and Asia for about 5 per cent each.

24. Seizure statistics of cannabis resin in 1999 reflected no major changes in relation to recent years, globally or at the country level. Global seizures amounted to almost 900 tons. The drug continues to originate mainly in Morocco and countries in south-west Asia, particularly Pakistan. The main consumer market remains western Europe, which accounts for about 77 per cent of the global seizure volume. South-west Asia accounts for less than 15 per cent and north Africa for 7 per cent.

### **Amphetamine-type stimulants**

25. The manufacture, trafficking and abuse of methamphetamine continues to be of great concern in North America. Statistics on laboratory detections as well as seizures have indicated rapidly rising trends since the mid-1990s. While all supply indicators continued to reflect rising trends in 1999, statistics on consumption of methamphetamine in the United States showed a levelling off recently.

26. The main concern with regard to amphetamine-type stimulants in North America is currently related to the trafficking and abuse of Ecstasy-type substances, which are imported in large quantities from western Europe.

27. Western Europe remains the primary source of amphetamine and Ecstasy-type substances. Amphetamine is manufactured, trafficked and consumed within the region, though eastern Europe has emerged

as an additional manufacturing zone in recent years. However, stimulant seizure statistics in Europe, for the first time, reflected a decrease in 1999. The production of Ecstasy-type substances remains more or less concentrated in western Europe. From there, it is trafficked worldwide, in particular to North America. Ecstasy remains more exposed to international trafficking than other amphetamine-type stimulants.

28. The second region where methamphetamine is produced, trafficked and consumed in large quantities remains east and south-east Asia, and the drug is rapidly becoming available throughout the region. Many countries reported increases in laboratory detections and seizure statistics in 1999. An enormous seizure volume of methamphetamine was reported by China, though no further information is available. The total of 16 tons recorded in China in 1999 is higher than the global seizure volume of stimulants (including amphetamine, methamphetamine and other stimulants) in previous years and would account for 50 per cent of the global seizure volume in 1999.

29. Western Europe and east and south-east Asia have each accounted for approximately 40 per cent of the global stimulant seizure volume in recent years, and North America for almost 20 per cent. This breakdown differed, however, in 1999, owing to the large seizure volume in China.

### **III. Illicit opium production in 2000 and potential availability of heroin to the world market**

30. The information on cultivation and production of plant-based drugs given in the present document is based on estimates. Data presented for 2000 are preliminary. The purpose of presenting such estimates, which include a certain margin of error, is to provide an indication of current trends in drug production and availability of drugs to consumer markets.

31. Illicit world production of opium has declined from the 1999 peak of more than 5,700 tons to an estimated 4,700 tons in 2000 (see figure 3). This trend is due mainly to a decrease in production in Afghanistan, which now accounts for about 69 per cent of global production, as compared to its 79 per cent share in 1999. Opium produced in Myanmar accounted for 23 per cent of global production in 2000. Other

countries in Asia together continue to account for less than 5 per cent and Latin America for about 3 per cent (see figures 1 and 2).

32. The area under poppy cultivation in Afghanistan declined slightly in 2000, but another important factor in the decrease in opium production was the drought during that year. The results from the UNDCP survey in Afghanistan<sup>1</sup> reflected a 10 per cent reduction in the area under cultivation, which declined from 90,583 hectares in 1999 to 82,171 hectares in 2000. Opium production decreased from 4,565 tons to 3,276 tons, a 28 per cent reduction (see figure 6).

33. The average farm-gate price for fresh opium in Afghanistan appears to have fallen in 2000, presumably as a result of the overproduction in the previous year. The value of opium at farm-gate prices in Afghanistan for the entire production in 2000 was estimated at about US\$ 90 million, while the value for 1999 was calculated at roughly \$180 million.<sup>2</sup>

34. Opium production in south-east Asia has declined in recent years, but may have increased again slightly in 2000 (see figure 5), a trend mainly relating to Myanmar. Estimates on the cultivation of opium poppy in Myanmar reflect a 20 per cent increase in 2000, following a decreasing trend during the previous two years. Myanmar accounts for less than one quarter of the global opium production in 2000, its share in 1999 being 15 per cent.

35. Illicit opium production in other producer countries in Asia remains limited. Lao People's Democratic Republic, Pakistan, Thailand and Viet Nam together continue to account for less than 5 per cent of global production, and trends indicate further reductions. The recent survey on poppy cultivation in Lao People's Democratic Republic indicated a reduction of the cultivation area from 26,800 hectares in 1998 to 19,000 hectares in 2000. However, production increased slightly because yields, which were particularly low in 1998 because of droughts, have returned to normal levels.<sup>3</sup> Opium poppy cultivation in Thailand declined during the 1990s, ranging between 170 and 770 hectares. For 2000, cultivation of a total of 330 hectares was reported.<sup>4</sup> In Pakistan, the 1999 opium poppy survey reflected a significant decrease. The area under poppy cultivation declined from an average of 900 hectares between 1996 and 1998 to 280 hectares in 1999.<sup>5</sup> Though data for 2000 are not yet available from Pakistan, current trends

indicate further declines. Latest data are also lacking from Viet Nam, but cultivation there has been reduced to a minimum in recent years. Finally, the worrying prediction of recent years in respect of the possible spread of poppy cultivation to central Asia has not materialized, as revealed in a survey carried out in Kazakhstan, Kyrgyzstan and Tajikistan in 1999.<sup>6</sup> The region is, however, extensively used as a trafficking zone for opiates (see sect. IV below).

36. In Latin America, opium production continues to take place in Colombia and Mexico. In the annual reports questionnaire for 1999, Colombia reported a total of 6,500 hectares under poppy cultivation. No exact data are available from Mexico. Unlike in many producer countries in Asia, some of which have a large opium consumer population, almost all opium produced in Latin America is converted into heroin and destined for export. Colombia reported heroin as the resulting product of the entire poppy cultivation, of which 99 per cent is destined for export. Finally, Peru reported the cultivation of opium poppy in the annual reports questionnaire for 1999. Though cultivation remains limited, it seems to be on the rise.

37. If all of the opium produced in 2000 (approximately 4,700 tons) were converted into heroin, the potential heroin production would be about 470 tons. (Although the conversion rate for processing opium into heroin is generally accepted at 1:10, the actual rate is subject to verification and may vary from country to country.)

38. In 1999, the potential heroin production was estimated at about 570 to 580 tons. The total amount of opiates seized in 1999 amounted to 85 tons (in heroin equivalent), an interception rate of 15 per cent. Thus, the potential availability of heroin to the world market in 1999 amounted to almost 500 tons (a figure derived from the deduction of the global opiate seizure volume from the potential heroin production) (see figure 4). By comparison, the potential heroin availability in 1998 was calculated at 360 tons, with an interception rate of 17 per cent. The heroin availability for 2000 would again be at less than 400 tons (assuming an average opiate seizure level).

## IV. Trends in opiate trafficking

39. Statistics on opiate seizures indicated a rising trend for 1999. In 1999, both opium and heroin seizure volumes reached the highest level ever recorded worldwide (see figure 7). Global opiate seizures (opium, morphine and heroin combined) rose consistently during the last two decades, increasing from a total of 9 tons (in heroin equivalent) in 1980 to almost 85 tons in 1999. The most significant increases took place during the 1980s and early 1990s, while in recent years statistics indicated a stabilization trend. In 1999, however, opiate seizures increased again by 13 per cent compared with 1998 and 24 per cent compared with the average seizure level of recent years.

40. The long-term trend in opiate seizures, as described in the previous paragraph, is consistent with the development in opium production. The rising opium production during the 1980s and early 1990s was followed by stabilization since the mid-1990s and a renewed increase in 1999. This congruence in respect of global production and seizure trends (see figure 8) confirms the usefulness of seizure statistics for measuring drug trafficking trends. Thus, the latest increase in opiate seizures in 1999 can be seen as a result mainly of the increase in opium production in Afghanistan during that year. Nevertheless, in analysing seizure statistics, it must always be kept in mind that seizures are an indirect rather than a direct indicator, measuring not only trafficking trends but also the level and effectiveness of law enforcement capacity in each country.

### Opium

41. Opium continues to be trafficked principally within the producer countries and to neighbouring States for consumption purposes, as well as for conversion into heroin. Trafficking of opium outside Asia remains limited.

42. Global seizures of opium (raw and prepared) amounted to 240 tons in 1999, the second highest level ever recorded and an increase of 36 per cent over the level for 1998 (see figure 9). The volume of opium seized worldwide has risen steadily over the last two decades, with annual seizure levels being at roughly 50 tons in the early 1980s. The Islamic Republic of Iran regularly recorded about two thirds of the opium intercepted worldwide. In recent years,

## Illicit opium production

Figure 1

### Global opium production in 2000

(Total: approximately 4,700 tons)

### Potential availability of heroin and global seizure volume of opiates, 1988-2000

Figure 5

### Production of opium in south-east Asia, 1988-2000

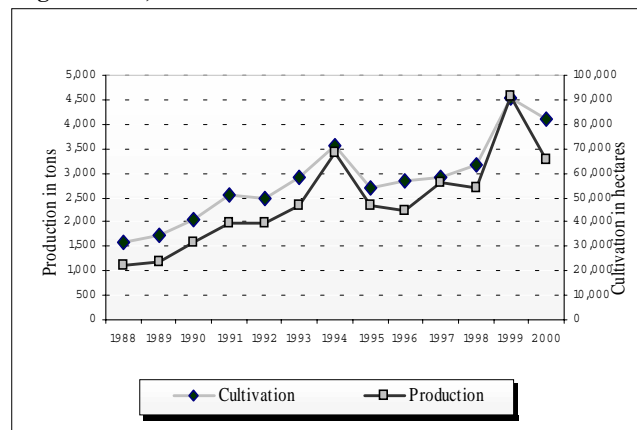

Figure 6

### Cultivation of opium poppy and production of opium in Afghanistan, 1988-2000

opium seizures by the Islamic Republic of Iran accounted for more than 80 per cent of the global total. The large increase in the volume of global seizures in 1999 is again mainly attributable to the Islamic Republic of Iran, which reported a total of more than 200 tons of opium seized during that year.

43. Other countries that continued to report significant opium seizures in 1999 (see figure 10) include China, India, Myanmar, Pakistan, the Russian Federation and those central Asian republics which border Afghanistan. Uzbekistan and Turkmenistan also reported relatively large opium seizures in 1999, amounting to 3.2 and 4.6 tons, respectively, while seizure increases in Tajikistan related mainly to heroin. The reported increase in central Asia and the Russian Federation is likely to be attributable to the increased trafficking and abuse of opiates in the region, but may also be due in part to enhanced law enforcement efforts implemented in some countries in recent years. Pakistan also reported a relatively large increase in opium seizures in 1999, which totalled 16 tons.

44. Opium seizures of quantities between 100 and 1,000 kg were recorded in 1999 in Kazakhstan, Kyrgyzstan, Lao People's Democratic Republic, Mexico, Thailand, Turkey and Viet Nam. Mexico reported a total of 800 kg, which represents a relatively large increase in comparison with the average level of about 200 kg seized in recent years.

45. Countries with significant opium seizures, as listed in the previous paragraphs, indicate places of opium production, opium consumption and/or heroin manufacture. The Islamic Republic of Iran is considered to have one of the highest opium addiction rates worldwide, with an estimated 1.2 million drug addicts or about 2 per cent of the population consuming opiates as well as cannabis products.<sup>7</sup> Opium consumption is also widespread, for example, in Lao People's Democratic Republic, where the national opium addiction rate was estimated at 2.1 per cent of the population aged 15 and above. An estimated 57 per cent of the opium produced within Lao People's Democratic Republic is reportedly consumed locally.<sup>8</sup>

46. Many countries in Asia have recognized a shift from opium smoking to the use of heroin, either smoked or, increasingly, injected. Nevertheless, opium consumption remains high. In China, opium consumption continues to be widespread, but the use of heroin is also rising. The country recently reported

680,000 officially registered drug addicts.<sup>9</sup> Estimates for Viet Nam indicated as many as 200,000 opiate drug users, of whom 50,000 are believed to inject heroin.<sup>10</sup> Statistics from Myanmar show over 86,000 drug addicts, most of which allegedly consume opiates in their various forms. The majority of opiate addicts in Pakistan are believed to consume heroin. In this context, it must be noted, however, that figures on officially registered addicts might not be realistic, as actual consumption rates tend to be much higher.

### Heroin

47. Trafficking of heroin continues to be widespread, affecting more and more countries worldwide. As with opium, global seizures of heroin reached the unprecedented level of over 35 tons in 1999 (see figure 11). The volume of heroin seizure has been rising steadily over the last two decades, mirroring the increasing trend in opium production. South-west Asia and western Europe continue to record the bulk of heroin interceptions, both subregions accounting for about 30 per cent of the global seizure volume in 1999. The east and south-east Asian subregion accounted for about 20 per cent, and central Asia, eastern Europe, south Asia and North America for less than 5 per cent each.

48. The increase in global heroin seizures in 1999 was due to only one subregion, namely south-west Asia, while all other regions worldwide reflected a stable or even slightly declining trend during that year. It seems that heroin trafficking (as reflected in seizure statistics) increased mainly in the area surrounding Afghanistan, which was also responsible for the large increase in opium production during that year. In this context, it is interesting to note that both the total seizure volume in the countries surrounding Afghanistan and opium production in Afghanistan rose by a similar factor (70 per cent) in 1999, while the total seizure volume in other regions, such as Europe for example, reflected only small changes (see figure 12). This might suggest that the massive amount of opium produced in Afghanistan in 1999 has not thus far been passed on to the same extent to global markets outside the region. Stable heroin prices in western Europe during 1999 further support this analysis.

## Opiate seizures: global trends

Figure 7

**Global opiate seizures, 1986-1999**  
(In heroin equivalent)

(In tons)

Figure 11

**Global heroin seizures, 1986-1999**

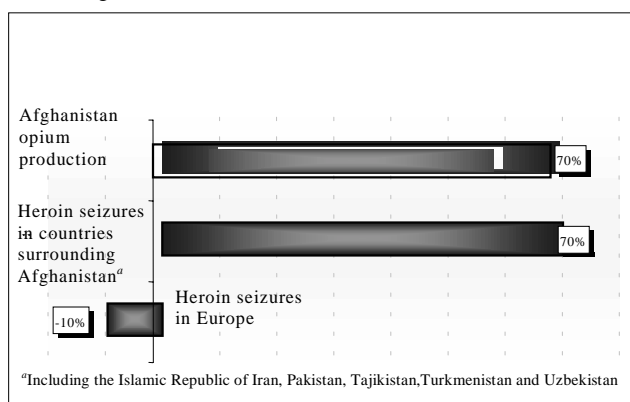

Figure 12

**Trends in heroin seizures in west Asia and Europe compared to opium production in Afghanistan in 1999**  
(Percentage increase/decrease over 1998)

49. Several assumptions are possible with regard to the destination of the excess of opiates produced in Afghanistan during 1999. Enormous seizure increases in some countries in the region (i.e. the Islamic Republic of Iran, Pakistan and Tajikistan (see figure 14)) indicate that law enforcement measures have successfully prevented part of the trafficking outside the region. There may also have been an increased flow of opiates into new or expanding consumer markets such as the Russian Federation, which recorded a large seizure increase for heroin as well as opium. Though no information is currently available, heroin may also be stockpiled within the region.

50. Seizures recorded in south-west Asia rose from 6.6 tons in 1998 to 11.3 tons in 1999. Both Pakistan and the Islamic Republic of Iran reported increases in heroin seizures during that year. However, while heroin interceptions in the Islamic Republic of Iran reached a record level in 1999 (rising from 2.9 tons to 6 tons, an increase of 108 per cent), those in Pakistan increased to a lesser extent (from 3.4 to 5 tons, or 48 per cent) and remained below the seizure level recorded in the past (6 tons on average) (see figure 14). Additionally, the Islamic Republic of Iran reported a total of 22 tons of morphine interceptions in 1999, which is similar to the level recorded in 1998.

51. The different trends reflected in seizure statistics of countries in south-west Asia suggest that some changes have occurred in the use of trafficking routes, as well as the location of heroin manufacturing sites in the region. As for manufacture, though the quality of heroin available throughout south-west Asia remains unclear, opiates seem to be increasingly trafficked out of Afghanistan directly in the form of heroin.<sup>11</sup> In the past, the Islamic Republic of Iran was primarily affected by trafficking of opium and morphine, the latter mainly transiting the country destined for clandestine heroin laboratories in Turkey. Heroin entered the country to a lesser extent and principally via its border with Pakistan, where heroin processing took place in the past. The increased trafficking of heroin through the Islamic Republic of Iran in recent years suggests that in addition to morphine processing capacities, laboratory facilities for manufacture of heroin must exist in the region. Such manufacturing sites may not only be located along the Afghanistan-Pakistan border area, but presumably also in the south-west of Afghanistan, bordering the province of

Khorasan in the Islamic Republic of Iran. Statistics on significant seizure cases reported by the Islamic Republic of Iran for 1999 confirm that the bulk of heroin was seized in Khorasan, which borders Afghanistan and Turkmenistan.

52. With regard to changes in trafficking routes in south-west Asia, the following trends (as indicated in reports of last year) seem to be confirmed by the latest seizure statistics. The southern route via Pakistan and India appears to have become less significant than in the past. Though seizures in both countries increased in 1999, they remain below the level intercepted before 1998, despite the rise in opium production in the region. At the same time, trafficking along the western route via the Islamic Republic of Iran appears to have increased to a greater extent (see para. 51 and figure 14). This route is also becoming increasingly connected to the northern routes across central Asian republics. Though seizures in those States continue to be relatively low, some available data reflect enhanced trafficking activities in the subregion. Latest data from Tajikistan indicate a very large increase in heroin seizures for 2000 (preliminary data referred to 1.5 tons, which is higher than, for example, the annual seizure volume in the United States and most European countries).

53. It seems that large amounts of opiates trafficked northwards and transiting central Asia flow into the Russian Federation. Heroin interceptions have gone up in recent years, reaching almost 700 kg in 1999. Consumption of opiates is reportedly on the rise in the Russian Federation, but the country is also used as a transit point. Reports received from Finland, for example, indicated that heroin is mainly smuggled into the country from the Russian Federation and is almost exclusively trafficked in the form of heroin hydrochloride of high quality.<sup>12</sup>

54. Other countries in eastern Europe have also reported that heroin from south-west Asia is increasingly transiting central Asia. The Czech Republic reported increased use of trafficking routes through central Asia for transporting heroin into Europe.<sup>13</sup> Countries in eastern Europe that reported relatively high heroin seizures in 1999 include Bulgaria (265 kg), the Czech Republic (108 kg) and Hungary (172 kg).

55. Turkey has recorded a relatively stable heroin seizure level of between 3.4 and 4.4 tons since 1995. Seizures in 1999 were at 3.6 tons, a 22 per cent decrease in comparison with 1998 (see figure 14). This suggests that Turkey was less affected by the latest increase in the use of the western and northern routes through the Islamic Republic of Iran and central Asian republics. Morphine seizures, however, slightly increased during that year, indicating that the traditional trafficking of morphine from south-west Asia into Turkey for conversion purposes is continuing.

56. Western Europe remains the main destination of heroin originating from south-west Asia. As mentioned above, it seems that the 1999 production increase in Afghanistan was not passed on to European consumer markets during that year, with prices as well as seizures of heroin in Europe reflecting more or less stable or even declining trends. The total volume seized in the region in 1999 amounted to 10.8 tons, which is slightly below the level of 1998 and accounts for 30 per cent of the global total (see figure 15). Seizure statistics from a number of countries reflect more or less stable trends in recent years. The Netherlands, which appeared to be the main entry point for heroin trafficking in 1998 (with seizure peaks above 2 tons), recorded lower quantities in 1999 (770 kg), which were, however, above the level of previous years. The main transit and destination countries for heroin trafficking in western Europe in 1999 were the United Kingdom of Great Britain and Northern Ireland, which intercepted over 2 tons of heroin, Italy (1.3 tons), Spain (1.2 tons) and Turkey, whose lower seizure total for 1999 was responsible for the regional decrease, though it remained the highest compared to other European countries (see figure 16).

57. Some significant seizure cases in Pakistan further indicated North America as the final destination of heroin trafficking. The significant seizure reports from Pakistan also confirmed that heroin trafficked out of the country is often routed through Africa or countries in the Near and Middle East. Though seizures remain relatively low, Africa continues to be used heavily as a transit point for drug trafficking. One of the most frequently used transportation methods along the southern route via Pakistan is part by air and part by sea, while the western and northern routes largely use road transport.

58. In east and south-east Asia, heroin seizure totals decreased in 1999, presumably owing to a decline in opium production in the region during that year, mainly related to Myanmar (see figure 17). China appears to have emerged as an important conduit for heroin trafficked outside the region. The country accounts for the highest heroin seizure volume in the region and recorded a total of 5.3 tons in 1999, which is a decrease in relation to the 1998 peak, but higher than in previous years (the 1999 decrease is assumed to be related to the decline in opium production in Myanmar during that year). In 1998 and 1999, China accounted for 80 per cent of the total volume of heroin seizure in east and south-east Asia. During the first part of the 1990s, however, the country's subregional share in heroin interceptions was less than 60 per cent. This development confirms trends of recent years indicating increased heroin traffic into China as a result of the displacement of heroin laboratories away from the Myanmar-Thailand border area.

59. Within China, traffickers appear to have identified new routes for further export. In addition to the Hong Kong Special Administrative Region (SAR) (China), other exit points for heroin trafficking outside China have emerged. Some seaports in south-east China are believed to have become departure points for heroin exports to Australia and North America, often via further transit countries. In this context, in a recent study on overland heroin trafficking routes and the spread of the human immunodeficiency virus (HIV) in south-east Asia, a new trafficking route was identified within China. In addition to the main flow of drugs eastwards, heroin may also be trafficked westwards into central Asia (i.e. Kazakhstan). This route has the potential to target European consumer markets, in particular for high-purity white heroin.<sup>14</sup>

60. Despite increased trafficking through China, other countries in the region, including Thailand, Malaysia and Singapore remain important transit countries for heroin trafficking, by air and sea, to Australia, Europe and the United States. Seizures in Malaysia and Singapore have been more or less stable in recent years, while those in Thailand decreased from an average of 1,500 kg during the early 1990s to less than 500 kg in recent years. Decreasing seizure statistics from Thailand may be the result of some recent shifts in the use of trafficking routes, as well as a decrease in opium production within the country and in the region as a whole in recent years.

61. As mentioned above, large quantities of opiates produced in south-east Asia are consumed within the region. Primary destinations outside the region continue to be the United States, Australia and Europe. However, from the information available, it remains difficult to provide a percentage breakdown of distribution and export patterns. Nevertheless, some national reports received provide an indication of the level of heroin consumption and origin of the drug available on domestic markets.

62. The United States recently estimated that about 3 tons of heroin—or about 15 per cent of the total domestic consumption—originates in south-east Asia (at least 80 per cent originates from Colombia and Mexico and less than 5 per cent from south-west Asia, with total domestic consumption being estimated at roughly 18 tons). According to the United States, by the mid-1990s heroin from south-east Asia had lost its previous market dominance to Colombian heroin, which began to offer an equal or even higher purity level. (Both regions are known for supplying consumer markets with high-quality white heroin, as compared to black tar heroin from Mexico.) Since 1997, however, statistical analyses of seizure patterns suggest a resurgence in heroin from south-east Asia entering the United States.<sup>15</sup>

63. The fact that only 3 tons of heroin are estimated to be trafficked from south-east Asia to the United States leads to the question as to the final destination of heroin produced in south-east Asia. The consumption of a total of roughly 3 tons of south-east Asian heroin in the United States would account for only 2 per cent of the estimated production level in the area known as the Golden Triangle, which produces roughly 100 to 180 tons of potential heroin per year. Although the level of opiate consumption within the region is high, the question remains as to the final destinations of heroin trafficked outside the region. Despite increasing heroin consumption in Australia, the market there continues to be relatively small.<sup>16</sup> Canada reported that Afghanistan, Myanmar and Thailand are principal sources of heroin, but the market remains secondary.<sup>17</sup> Europe remains the main heroin consumer area, but is primarily supplied by south-west Asian heroin.

64. Seizures of heroin in the Americas indicate rising trends over the last two decades. Seizures in 1999 amounted to 2.3 tons, a 10 per cent increase over 1998. The United States accounts for the bulk of heroin

interceptions in the region, though seizures for the first time in years seemed to have decreased slightly. Increases were, however, noted in Colombia and Mexico, where seizures amounted to 514 and 260 kg, respectively (see figure 18).

65. In Australia, researchers have noted a growing acceptance of and rise in the abuse of heroin. According to the Government of Australia, the drug is readily available at street level throughout the country. In response to the wide availability of heroin in the country, wholesale and retail prices have tended to decline in recent years. Further, the number of deaths caused by heroin-related overdoses in Australia continues to rise and has become of serious concern.<sup>18</sup> The rising availability of heroin in Australia is also reflected in the country's seizure statistics. Heroin seizures have been rising in recent years and increased by 130 per cent in 1999, reaching 690 kg.

## **V. Illicit production of coca leaf in 2000 and potential availability of cocaine to the world market**

66. The information below on illicit coca production is based on estimates and includes a certain margin of error. Because of the current absence of reliable surveys, the data presented summarize the information available from various sources. The aim is to provide a realistic overview of the potential availability of cocaine to the global market.

67. Global illicit coca bush cultivation and production of coca leaf appear to have been more or less stable in 2000 compared to previous years, with an estimated 800 tons of potential cocaine produced. Throughout the 1990s, potential annual cocaine conversion at the global level is assessed to have fluctuated between roughly 800 and 900 tons, following a steadily rising trend during the previous decades (see figure 19). The stabilization in coca production is a result of decreasing trends in Peru and Bolivia in recent years, which have been offset by increases in Colombia (see figure 20).

68. According to information provided in the annual reports questionnaires, coca production in Colombia has risen steadily in recent years. The cultivation area increased from a total of 45,000 hectares in 1995 to

## Heroin seizures: regional trends

### Heroin seizure trends in the highest ranking countries in west Asia and Europe in 1999

(Percentage increase/decrease over 1998)

Figure 16

### Heroin seizures in western Europe, 1999: ranking of countries (In tons)

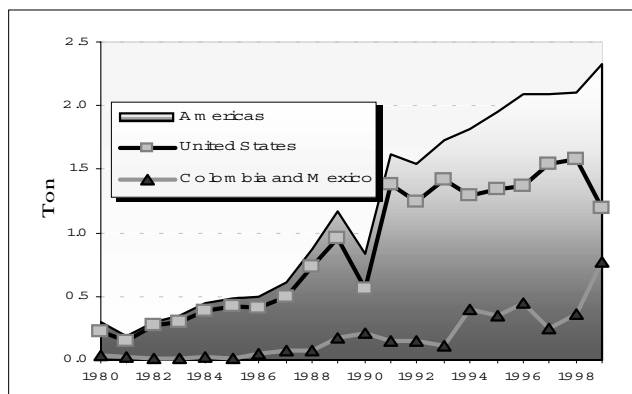

Figure 18

### Heroin seizures in the Americas and trends by country, 1980-1999

over 100,000 hectares in 1999. The resulting conversion into potential cocaine reportedly rose from about 350 tons to as much as 550 tons during that period. Particularly large increases have been noted since 1998. Though data for 2000 are not yet available, cocaine production in Colombia could potentially reach 600 tons, if the trend of recent years continues.

69. Information received from Peru indicates a significant decline in coca production during the 1990s. Preliminary estimates for 2000 reflect that illicit coca cultivation in Peru covered an area of 37,200 hectares in 2000, which is slightly lower than the level of 38,700 hectares in 1999 and represents a 70 per cent decrease in comparison with the early 1990s. Potential cocaine production in Peru may be estimated at 170 tons in 2000, as compared to roughly 500 to 550 tons during the early 1990s. In this context, it must be noted, however, that some cultivation areas in Peru, which were abandoned in recent years, may have been reactivated since 1999. From the information currently available, it cannot be assessed whether this development will initiate a renewed increasing trend, or if production will remain within a certain fluctuation range. The recent reactivation of some cultivation areas may be a result of rising farm-gate prices.

70. Illicit coca production in Bolivia has also declined significantly over recent years. Cultivation areas, amounting to an estimated 36,000 hectares until 1996, declined to some 10,000 hectares in 1999. In 2000, illicit cultivation of coca bush in Bolivia is assumed to have decreased by another 50 per cent, now covering an estimated area of 5,000 hectares. The resulting conversion into potential cocaine could fall from an estimated 250 tons during the mid-1990s to less than 40 tons in 2000.

71. Farm-gate prices for coca leaf, as well as coca base, appear to have risen in Bolivia and Peru since 1999. In Bolivia, for example, farm-gate prices rose from an average of \$1.5 per kilogram of coca leaf in 1998 to \$2.7 in 1999 and \$3.7 in 2000. It is assumed that prices are rising because of shortages of cocaine due to eradication efforts. Rising price trends carry the danger of being seen as an incentive to farmers to return to illicit coca cultivation, as has been observed in Peru recently.

72. The potential annual availability of cocaine to the world market is calculated on the basis of the total annual production (in all three source countries) minus the global cocaine seizure volume per year. The result would be a "potential availability", not taking into account the volumes consumed as coca leaf as well as quantities of coca products lost or destroyed during the conversion and trafficking processes. With an estimated total of roughly 800 tons of potential cocaine produced in 1999 and a total of about 360 tons of cocaine seized worldwide during that year (sect. VI below), the potential availability of that drug for global consumer markets would be 440 tons. This would relate to an interception rate of 45 per cent in 1999 (see figure 21).

73. Cocaine interception rates seem to have risen from about 33 per cent in the past to over 40 per cent in recent years (as a result of relatively stable or declining production in relation to rising seizure levels). This development could be attributed in part to strengthened law enforcement by Governments. Yet there remains a certain element of doubt, not only with regard to the high interception rate, but also whether a total of 440 tons of cocaine availability actually covers worldwide consumption. Nonetheless, cocaine demand seems to be satisfied, given falling or stable retail prices in all major consumer markets in recent years.

74. Though exact assessments of global cocaine consumption are currently not available, some estimates indicate figures that are higher than the above-calculated availability of 440 tons. In a recent study by the United States, for example, global consumption figures were estimated at roughly 650 tons. According to the study, the breakdown of consumer markets included the United States, which consumed close to 300 tons, South America, which consumed both coca leaf (equivalent to roughly 50 tons of pure cocaine) and about 100 tons of pure cocaine, Europe, with an estimated 150 tons and the remaining smaller markets, including Australia, Canada, Mexico, the Russian Federation, South Africa, Asia and Central America, combined to consume something less than 50 tons.<sup>19</sup>

## Illicit coca production

Figure 19

**Global illicit coca cultivation/production and potential cocaine manufacture, 1987-2000**

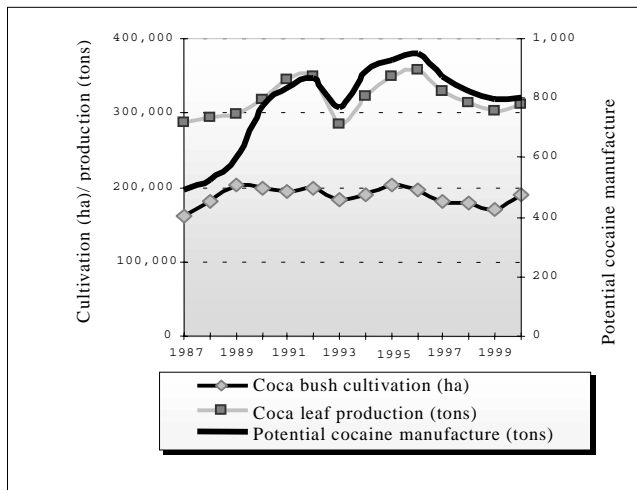

Figure 20

**Potential cocaine manufacture: trends by producer country, 1990-2000**

Figure 21

**Potential cocaine availability and global seizure volume, 1987-2000**

Figure 22

**Global potential cocaine production in 2000**

(Total: approximately 800 tons)

## VI. Trends in cocaine trafficking

75. Global cocaine seizures amounted to almost 360 tons in 1999, which is below the massive 1998 peak but above the level of previous years (see figure 23). Interceptions in the Americas account for about 90 per cent of the cocaine seizures worldwide, the remainder being seized in western Europe. The total seizure volume in the Americas (see figure 25) rose rapidly during the 1980s and appeared to have levelled off in the 1990s, mirroring the global coca production trend over that period. The rising seizure levels in 1998 and 1999 might be a further indication that coca production was also higher than currently estimated.

76. The large cocaine seizure volume of 1998 was primarily related to Colombia, where interceptions rose from an average level of 50 tons between 1990 and 1997 to over 100 tons in 1998. In 1999, cocaine interceptions in Colombia returned to a lower level, amounting to 63.9 tons. However, the country reported an additional large seizure volume of liquid cocaine during that year. Colombia's cocaine seizures on average account for about 20 per cent of the regional seizure volume (see figure 25).

77. Seizure trends in other coca producing countries reflected minor changes in 1999, most of which are within the fluctuation range of recent years. Cocaine interceptions in Peru have been increasing again over the last three years and amounted to 11.3 tons in 1999. This seizure level is, however, below the volume recorded in Peru during the 1980s (up to 50 tons) and mid-1990s (about 20 tons). The latest increase in cocaine seizures in Peru might confirm recent information with respect to a reactivation of some abandoned cultivation areas, following the enormous reduction in coca production and trafficking since the early 1990s. Interceptions in Bolivia continue to decrease, amounting to 7.7 tons in 1999. This trend is in line with the decrease in coca production in recent years.

78. Significant increases in cocaine seizure were recorded in Ecuador and Venezuela in 1999, with those in Ecuador at a record level of over 10 tons and those in Venezuela being the second highest volume ever recorded (12.4 tons). Both countries border Colombia.

79. Cocaine interceptions in Brazil increased to 7.4 tons in 1999, while those in Argentina declined significantly in 1998 and 1999, with total interceptions in 1999 amounting to 1.7 tons. The use of Argentina as a transit country for cocaine trafficking has declined, possibly as the result of Bolivia's success in coca eradication in recent years.

80. Seizures in Central America and the Caribbean decreased in 1999. Both subregions together accounted for about 9 per cent of the cocaine seized in the Americas in 1999, their share being slightly higher in the past. Seizures remained relatively high in Guatemala (10 tons), but decreased significantly in Costa Rica (2 tons) and Panama (3 tons). In the Caribbean, the highest seizure levels (between 1 and 2.5 tons) were recorded in 1999 in the Bahamas, the Cayman Islands, Cuba, the Dominican Republic and Jamaica.

81. Cocaine continues to be directed to two main markets, the United States and western Europe, the latter remaining secondary. Interceptions in the United States fluctuated between 100 and 130 tons during the last decade, indicating a stabilization trend. Seizures of recent years, however, reflected a slight increase again, resulting in a total of more than 132 tons in 1999, the highest level ever recorded and a 13 per cent increase over 1998. Cocaine interceptions in the United States account for about 40 per cent of the regional and 37 per cent of the global seizure volume (see figure 25).

82. In the United States, trafficking routes and cocaine distribution patterns seem to have changed over recent years. According to a recent inter-agency intelligence assessment reported by the United States,<sup>20</sup> approximately 60 per cent of the cocaine smuggled into the United States crosses its south-west border. Over the past decade, the Colombia-based drug groups allowed Mexico-based trafficking organizations to play an increasing role in the United States cocaine trade. The result of this today, according to the report, is that traffickers operating from Colombia control wholesale levels of cocaine distribution throughout the heavily populated north-eastern United States and along the eastern seaboard, while traffickers operating from Mexico now control wholesale cocaine distribution throughout the western and mid-western United States. Another development of recent years was a shift of the United States-based command and

control centre of the organized crime groups in Mexico from southern California to Chicago.

83. As for western Europe, following the alarming predictions throughout the 1990s with respect to cocaine flooding the region, 1998 seizure statistics provided encouragement, as they indicated, for the first time, a decline (see figure 27). The regional seizure total for 1999, however, reflected another increase, reaching an unprecedented level of over 42 tons, a 22 per cent increase over 1998. Yet compared to 1997, seizures in 1999 increased by only 9 per cent. Rising seizure trends suggest that Europe continues to be an important target area for cocaine trafficking and consumption.

84. Main entry points for cocaine trafficked into western Europe remain Spain and the Netherlands (see figure 28). Seizures in Spain went up again in 1999, totalling 18 tons, after having fallen significantly in 1998. The Netherlands, which recorded a record level of 11.5 tons in 1998, reported a slightly lower quantity for 1999 (10.4 tons) though this was higher than in previous years. Interceptions also increased in France (3.7 tons), Germany (2 tons) and Italy (3 tons), while those in Belgium and the United Kingdom decreased slightly to 1.7 tons each. In this context, Germany reported that the quantity of cocaine seized in 1999 at the Frankfurt airport alone was larger than the total quantity seized at all German airports in 1998.<sup>21</sup>

85. Some rising cocaine seizures in eastern Europe in recent years indicate that the subregion might increasingly be used as an entry point for cocaine into Europe. In 1999, however, seizures were at the lowest level since 1992 (360 kg). Additionally, cocaine interceptions in Turkey, which were relatively high in 1998, decreased to a very low level in 1999 (13 kg). Whether this one-year trend is related to a normal fluctuation or indicates a shift away from the use of eastern Europe as a cocaine entry point for the region remains to be seen in future statistics.

86. Africa continues to be used as a transit area for cocaine trafficking from Latin America to western Europe. Statistics of drug seizures, however, remain an unsatisfactory indicator to measure drug trafficking in Africa. Only about 0.1 per cent of the cocaine seized worldwide in 1999 was recorded in Africa, most of it in South Africa. South Africa recorded a total of

347 kg of cocaine seized in 1999, which is below the 1998 peak, but higher than in previous years. Seizures in Angola declined in 1998 and 1999, and those in Nigeria have remained at a relatively low level since 1995. This might suggest that trafficking routes have diverted to other entry and transit countries in the region. With 32 kg, Senegal recorded the largest cocaine seizure volume in west and central Africa in 1999.

87. Cocaine has made an appearance in Asia in recent years, but trafficking remains limited. Seizures for 1999 were rather low in Lebanon and Israel, the only countries recording significant quantities in recent years. Both countries and the Syrian Arab Republic each recorded about 30 kg in 1999. Japan reported cocaine seizures on a regular basis throughout the last decade, but the quantities seized remained insignificant and have reflected a decrease in recent years (10 kg in 1999).

88. Cocaine seizures are slightly higher in Australia, amounting to more than 100 kg in 1999. Though the drug seems to be readily available in some major cities, cocaine use in the rest of the country does not appear to be significant.<sup>22</sup>

## VII. Trends in cannabis trafficking

89. Cannabis remains the most widespread plant-based drug, and cultivation and trafficking occur in most countries worldwide. Data and statistics on illicit cultivation and wild growth of cannabis continue to be scarce. The principal source and consumer regions for both cannabis resin and herb, as identified in the past, remain unchanged.

### Cannabis herb

90. Cannabis herb continues to be grown and trafficked primarily in Africa, the Americas and central, south and south-east Asia. In addition, indoor cultivation of cannabis continues to be of great concern in Europe and North America.

91. Annual seizures of cannabis herb, which fluctuated widely at the global level during the 1980s, appeared more stable during the 1990s, with lower level seizures between approximately 2,000 and just

## Cocaine seizures: global and regional trends

Figure 23

Cocaine seizures in the Americas and trends in the highest ranking countries, 1986-1999

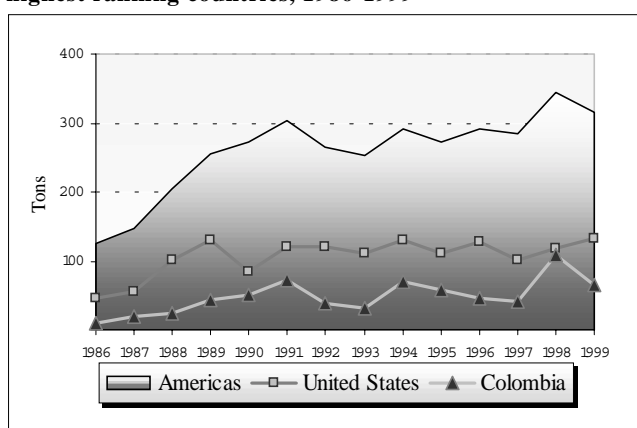

Figure 26

Cocaine seizures in Africa and trends in the highest ranking countries, 1986-1999

Figure 27

Cocaine seizures in Europe, 1986-1999

Figure 28

Cocaine seizures in Europe in 1999: ranking of countries (In tons)

above 3,000 tons. In 1999, however, seizures of cannabis herb rose again reaching almost 4,000 tons, an increase of 35 per cent over 1998 and 46 per cent over the average level during the 1990s (see figure 29).

92. The rise in cannabis herb seizures in 1999 occurred mainly in the Americas. Seizures in the Americas accounted for 80 per cent of the global seizure volume, up from the average of approximately 66 per cent of previous years. Changes in the total cannabis herb seizures in other regions were less significant in 1999, with Africa accounting for more than 10 per cent of cannabis herb seized worldwide and Europe and Asia for about 5 per cent each (see figure 33).

93. In the Americas, more than 80 per cent of the cannabis herb seizures in the region are made in Mexico and the United States (see figure 30). While the former is used primarily as a source and transit country, the latter appears to be an important destination of cannabis herb traffic. Interceptions appeared relatively stable in recent years, however, both countries recorded an increase in 1999, with seizures climbing to the highest level since the early 1980s. Seizures in Mexico amounted to 1,470 tons and those in the United States to 1,170 tons. Canada recorded 45 tons, which is within its average fluctuation range of recent years. Whether the seizure increase in North America is a one-time peak or indicates a new trend for increased cannabis herb trafficking in the future remains to be seen. However, it seems that rising trends remain limited to the main traditional markets, with currently no indication of increased cannabis herb trafficking in other regions.

94. Interceptions in Colombia, another major source of cannabis herb, amounted to 70 tons in 1998 and 1999, continuing the decreasing trend of previous years. Several other countries in South America, however, recorded increases in 1999, most significantly Brazil and Paraguay, which reported a total of almost 70 tons and 200 tons, respectively.

95. In the Caribbean, cannabis herb seizures also increased slightly in 1999 and remained dominated by the volume intercepted in Jamaica (56 tons). Large quantities of cannabis herb trafficked in the Americas continue to originate in Jamaica, along with other source countries in the subregion.

96. Large-scale cannabis cultivation and trafficking also remains widespread in Africa, and involves mainly local consumption and distribution within the subregions. Statistics of drug seizures in Africa do not sufficiently reflect the extent of trafficking in the region. Nevertheless, various countries continue to report significant quantities of cannabis herb interceptions, particularly in southern Africa. The bulk there is seized in South Africa, which recorded a total of 290 tons in 1999, an increase over recent years, but below the level seized previously. Other countries in southern Africa that recorded relatively large quantities of cannabis herb seizures in 1999 include Swaziland (33 tons) and Malawi (27 tons).

97. Western Africa appears to be another major area for cannabis cultivation and consumption in the region. Seizures have generally been highest in Nigeria and Senegal. Trends in cannabis herb seizures in Nigeria have been stable since 1994, and amounted to 17.7 tons in 1999. Senegal recorded 7.2 tons in 1999, a decrease from previous levels, which had ranged between 13 tons and 84 tons since 1995. In north Africa, in addition to the availability of cannabis resin, Egypt and Morocco have reported significant cannabis herb seizures in recent years. In 1999, Egypt seized 22.6 tons, but no seizures of cannabis herb were reported from Morocco.

98. In Asia, cannabis herb seizures continue to be concentrated in south and south-east Asia, with fluctuating trends in recent years. In 1999, largest seizure volumes were recorded in Thailand (57.7 tons), one of the major source countries in the region. Seizures in India, however, decreased to 38.6 tons, the lowest level since the early 1980s.

99. Central Asia, in particular Kazakhstan, covers large areas of cannabis wild growth as well as cultivation.<sup>23</sup> Seizure statistics from countries in central Asia and the Caucasus are not yet available on a long-term basis and therefore may insufficiently measure the trafficking situation of drugs in the subregion. However, Georgia and Kazakhstan recorded relatively large cannabis herb seizures in 1999, amounting to 32 tons and 10.5 tons, respectively.

100. In addition, the Russian Federation recorded a total of 33.8 tons of cannabis herb seizures in 1999, an amount which is slightly higher than in recent years. The only other country in eastern Europe with

relatively large cannabis herb seizures in 1999 was Bulgaria, with 29.4 tons.

101. Trafficking of cannabis herb in western Europe remains at a somewhat lower level than in other regions. In addition, seizure statistics indicate a declining trend in recent years. Total quantities of cannabis herb intercepted in western Europe have been steadily decreasing in recent years, though they remain higher than during the 1980s. The Netherlands intercepted relatively large quantities between 1993 and 1995, but seizures have been declining since, amounting to 47 tons in 1999. Italy and the United Kingdom recorded 21 tons and 15 tons, respectively, in 1999, a decrease over recent years, but higher than during the early 1990s. Cannabis herb seizures have fallen significantly in Belgium from an average of 40 tons in previous years to less than 3 tons in 1998 and 1999. Germany reported 15 tons, which is within the fluctuation range of recent years. The only country reflecting an increasing trend seems to be Greece, where cannabis herb seizures climbed from less than 1 ton before 1995 to over 12 tons since 1997.

### **Cannabis resin**

102. Seizure statistics of cannabis resin in 1999 reflect no major changes over recent years, globally or at the country level, suggesting that the main origins of the drug, the trafficking routes used and the major consumer areas remained unchanged. The main sources of cannabis resin continue to be Morocco and countries in south-west Asia, particularly Pakistan. As with cannabis herb, exact data on the extent of cannabis resin production is not available. The main consumer market remains western Europe.

103. Global seizures of cannabis resin have reflected a more or less stable trend in the last few years (see figure 31). A total of almost 900 tons was seized worldwide in 1999, a volume similar to that intercepted in 1998. Additionally, the percentage breakdown of seizures per region remained similar in both years. Western Europe accounted for about 77 per cent of the global seizure volume of cannabis resin, south-west Asia for less than 15 per cent and north Africa for 7 per cent.

104. This recent stability was, however, preceded by a continuous rise in the global seizure volume during the last two decades, reaching a peak of over 1,000 tons in 1995. The shares of the three subregions in the global

seizures have shifted during this period. Seizures in western Europe rose continuously during the 1980s and 1990s. Those in south-west Asia and north Africa, however, fluctuated rather widely in the past and seem to have followed a decreasing trend in recent years (see figure 34).

105. North Africa remains a major source of cannabis resin. Morocco continues to account for about 90 per cent of the cannabis resin seizures in Africa. Interceptions have decreased during the last few years, amounting to 54.8 tons in 1999. Other countries in Africa recording seizures of cannabis resin in 1999 include Algeria (4 tons) and Tunisia (1.9 tons).

106. The bulk of cannabis resin seizures in south-west Asia continues to take place in Pakistan, where seizures amounted to 81.5 tons in 1999. Though this reflects a slight increase over 1998, the trend in recent years is one of decline, and Pakistan's seizures now account for less than 60 per cent of the regional total, down from more than 80 per cent previously. During recent years, the volume of cannabis resin intercepted in the Islamic Republic of Iran has increased, though it remained at a lower level (18.9 tons) than that of Pakistan in 1999. Additionally, Oman and Turkmenistan recorded a relatively large seizure volume of cannabis resin in 1999, amounting to 14.3 tons and 10.4 tons, respectively. Other countries in Asia with a seizure level between 1 and 3 tons include Bahrain, India, Nepal, the United Arab Emirates and Saudi Arabia. Though consumption of cannabis resin is high in some countries in Asia, many States are also used as transit countries for trafficking to western Europe.

107. Western Europe remains the main consumer region for cannabis resin. Seizures have been increasing rapidly over the last two decades and remain dominated by Spain, which continues to be the main entry point of cannabis resin trafficked to western Europe. The country recorded seizures of over 430 tons in 1999, which is more or less in line with 1998, but much higher than ever before and accounts for 48 per cent of the global seizure volume (see figure 32). Other major entry and transit countries in Europe are France and the Netherlands, which reported more than 60 tons each, reflecting a slight increase in the case of France. Italy recorded a relatively large seizure volume of 46.8 tons in 1999, while cannabis resin seizure in the United Kingdom seems to have declined from an

Figure 34

Cannabis resin seizures by region, 1990-1999

average 90 tons in recent years to 33.7 tons in 1999. The only other countries in the region with cannabis resin seizures above 10 tons in 1999 are Denmark, Portugal and Turkey, and seizures between 1 and 5 tons were recorded in Belgium, Germany, Ireland, Norway and Sweden.

108. Cannabis resin seizures in the Americas remain limited. The only country recording significant quantities remains Canada, though seizures have declined in recent years, amounting to 6.5 tons in 1999.

## **VIII. Manufacture and trafficking trends of amphetamine-type stimulants and other synthetic drugs**

109. The illicit manufacture and trafficking of amphetamine-type stimulants continues to take place predominately in the three main regions: North America, western Europe and south-east Asia. Unlike with plant-based drugs, the production of synthetic drugs occurs within their main consumer areas. Trafficking is, therefore, to a large extent limited to the regional level. The exception to this remains the Ecstasy-type substances. While trends in western Europe and in North America reflect some stabilization, south-east Asia is emerging as a rapidly rising market.

110. The statistics on detection of clandestine laboratories as set out in the present section do not provide an indication of the volume of drug production, but rather an overview of trends and regional locations of drug manufacture. (Further information on the limitations and usefulness of the laboratory statistics is given in section I above.)

### **Methamphetamine**

111. Illicit manufacture of amphetamine-type stimulants in North America continues to relate primarily to methamphetamine. Statistics on the detection of clandestine methamphetamine laboratories in North America reflected a massive increase in recent years (see figure 35). Manufacture of this drug primarily takes place in the United States and to a lesser extent in Canada and Mexico. In the United States, the number of clandestine methamphetamine laboratories seized has increased rapidly since 1996, rising from an

average of 400 between 1985 and 1995 to 2,063 in 1999.<sup>24</sup> Illicit manufacture of amphetamine, on the other hand, though always at a much lower level in the United States and less significant than methamphetamine, decreased over this period from an average of 80 laboratories detected per year during the 1980s, to 2 to 5 since 1994) (see figure 37). The increased number of methamphetamine laboratory detections might, however, be related to increased law enforcement activities or a trend towards detection of smaller laboratories, because indications are that abuse of methamphetamine in the United States is levelling off. Methamphetamine manufacture reported by Canada and Mexico also reflected increases in 1999, but figures remain much lower than in the United States (Canada reported 12 and Mexico 13 laboratories).

112. Methamphetamine manufactured in North America continues to supply mainly domestic markets. Parallel to the rising trend in laboratory statistics, seizures of stimulants have been rising in North America since 1996, despite stable consumption trends (see figure 39). Annual stimulant seizures in the United States, most of which refer to methamphetamine, rose from a few hundred kilograms during the early 1990s to an unprecedented level of 2.6 tons in 1999. Mexico has also recorded significant quantities of methamphetamine interception over recent years, peaking at 358 kg in 1999.

113. The second region where methamphetamine is produced, trafficked and consumed in large quantities remains east and south-east Asia. The availability of the drug is spreading fast throughout the entire region. Clandestine manufacturing activities seem to be concentrated, inter alia, in the Myanmar-Thailand border area, which was once exclusively known for heroin production. The traditional drug production has expanded in recent years to include also methamphetamine manufacture, which is increasingly becoming the focus of drug traffickers in the region. No data are available on laboratory detections in Myanmar, but Thailand has reported the discovery of 12 to 16 laboratories per year since 1996. According to unconfirmed information received, about 50 new methamphetamine laboratories have emerged recently along the border area, which seems to have become a major source for methamphetamine trafficked and consumed throughout the region. Increases in methamphetamine trafficking in east and south-east

Asia are also reflected in seizure statistics from the region (see figures 41-44).

114. As in most countries in south-east Asia, stimulant seizures in Thailand and Myanmar reached unprecedented peaks in 1999. During the early 1990s, Thailand's average seizure level was about 700 kg, which steadily increased in recent years to 4.5 tons in 1999. Interceptions in Myanmar have risen from 60 to 311 kg over the last four years (see figure 43).

115. China appears to be another major source of methamphetamine in the region. In 1995 and 1996, it reported the detection of a large number of methamphetamine laboratories. Though no data are available for recent years, the International Narcotics Control Board (INCB) reported that China has remained a major source of clandestinely manufactured amphetamine-type stimulants.<sup>25</sup> The country also appears to be a principal source of ephedrine, which is used in the manufacture of methamphetamine and trafficked throughout the region. In addition to manufacturing activities, China also seems to serve as a trans-shipment point for the illicit traffic of stimulants originating in Myanmar and Thailand and transported into Japan and the Republic of Korea. Seizures in China, which were just over one ton in recent years, climbed to a worldwide record level of 16 tons in 1999. No further information is available on this enormous seizure total, which would make China account for about 50 per cent of the global stimulant seizure volume (mainly amphetamine and methamphetamine) and the entire region of east and south-east Asia for more than 75 per cent of the global total in 1999 (see figures 42 and 44). For the first six months in 2000, the Government of China reported a total seizure volume of more than 17 tons of methamphetamine and more than 10 tons of ephedrine.<sup>26</sup>

116. The Republic of Korea reported the detection of two methamphetamine laboratories during 1999 and also indicated that the most notable feature in methamphetamine trafficking since 1998 was the increased smuggling of the drug from sources in Thailand. However, the majority of importations continue to originate in China and, to a lesser extent, the Philippines.<sup>27</sup> Stimulant seizures in the Republic of Korea have remained relatively stable in recent years, amounting to 29 kg in 1999.

117. The Philippines reported the discovery of three methamphetamine laboratories in 1999 and

indicated that additional quantities of that drug were illegally imported from China. A total of 944 kilograms were seized in 1999, which is a 20 per cent increase over to the last record in 1996 and more than 10 times higher than in 1998 (see figure 43). According to the Government, methamphetamine, locally known as "shabu", has become the most commonly abused drug in the Philippines.<sup>28</sup>

118. Similarly, Japan has faced an enormous increase in trafficking and abuse of methamphetamine, which is the most widely abused drug in the country.<sup>29</sup> Of the arrests made in 1999, 93 per cent involved stimulant drug offences and the seizure quantity of that year (1.9 tons) exceeded the total amount confiscated over the previous five years (average of 350 kg per year) (see figure 43).

119. Methamphetamine manufacture and abuse has also been reported by New Zealand. The country detected six clandestine laboratories in 1999, but stimulant seizures remained relatively small. In Australia, amphetamine-type stimulants have become the most frequently used illicit drug after cannabis. The country reported the detection of 131 clandestine laboratories during 1998-1999, most of which were involved in methamphetamine production, but also other amphetamine-type stimulants. Stimulant seizures in Australia have decreased in recent years, from over 600 kg in the mid-1990s to 180 kg in 1998, which may be the result of increased domestic production and a smaller demand for imported products.<sup>30</sup>

120. The availability of methamphetamine in Europe remains limited. The only country with illicit methamphetamine production continues to be the Czech Republic, where the drug is destined for the domestic market. The country reported the discovery of 27 manufacturing sites in 1999 and between 7 and 50 per year during the last decade. In 1998, Ukraine reported for the first time that illicit methamphetamine manufacture was taking place. The country reported the detection of seven methamphetamine laboratories, but no data are available for 1999. Slovakia also reported the detection of two laboratories involved in the illicit manufacture of methamphetamine in 1999. A number of countries in western Europe reported small quantities of methamphetamine seizures, but the drug does not seem to pose a significant threat to the region

## Amphetamine-type stimulants: manufacture and seizure trends in North America

**Stimulant (mainly methamphetamine) seizures in east and south-east Asia, 1998-1999: ranking of countries (excluding China)**

(In tons)

Figure 44

**Methamphetamine seizures in China, 1998-1999**

at present. However, some concern exists with regard to a possible initiation of methamphetamine smuggling from south-east Asia to Europe.

121. Finally, Egypt continues to report the manufacture of methamphetamine (referred to as maxiton forte). However, seizures of that drug type, which have been relatively large during the 1980s and early 1990s, have decreased significantly in recent years. Other countries in Africa and the Near and Middle East reporting stimulant seizures in 1999 include Nigeria (322 kg), Saudi Arabia (75 kg), Côte d'Ivoire (56 kg) and the Syrian Arab Republic (15 kg).

### Amphetamine

122. The production and abuse of amphetamine continues to be concentrated in Europe. Eastern Europe has emerged as a manufacturing zone in recent years, however, the most important production area remains western Europe, with Germany, the Netherlands and the United Kingdom continuing to report the highest number of clandestine amphetamine laboratories. In addition, amphetamine manufacture has been reported in Belgium, Denmark, Spain and Sweden in recent years, and similar reports were received from Finland and Italy in 1994 and 1995 (see figure 45).

123. In eastern Europe, reports have been received from various countries since 1991 on laboratory seizures relating to amphetamine manufacture (except for the Czech Republic and other countries where the manufacture of methamphetamine takes place). Throughout the 1990s, Poland noted an increasing trend in illicit amphetamine manufacture taking place in the country, with up to 10 laboratories detected per year (8 were detected in 1999). Bulgaria reported two laboratory detections during that period and Hungary one. In addition, the manufacture of amphetamine seems to have spread to the Baltic States. Since 1996, Estonia and Latvia have reported two and Lithuania one amphetamine laboratory.

124. As for seizure statistics, interceptions of stimulants in Europe, most of which seem to relate to amphetamine, decreased for the first time in 1999 at the regional level, after a steadily rising trend through the 1980s and 1990s (see figure 47). The regional seizure total reached almost 5 tons in 1998, but dropped to 3.8 tons in 1999. This decline was primarily related to the United Kingdom, which recorded about 50 per cent of the regional stimulant seizure total

during the last decade. Stimulant interceptions in the United Kingdom increased significantly during the 1990s, climbing to a peak of 3.3 tons in 1997, but decreased in 1998 and in 1999, when seizures totalled 1.2 tons. A number of other countries in western Europe with large seizure totals (see figure 48) noted a decrease in 1999, including the Netherlands (853 kg), Belgium (330 kg), Norway (52 kg) and Spain (50 kg). However, seizures in the Netherlands continue to account for the second largest volume in Europe, following the United Kingdom. Stimulant seizures continue to reflect rising trends in Finland (133 kg), France (233 kg), Germany (360 kg) and Sweden (246 kg). The decreasing trend in several countries, including the highest ranking (the Netherlands and the United Kingdom), indicates a stabilization trend with regard to amphetamine trafficking in Europe.

125. In eastern Europe, smuggling of stimulants has increased over recent years, though seizures remain at a much lower level than in western Europe. Bulgaria, the Czech Republic, Hungary, Poland and Ukraine have reported relatively large seizure volumes. The bulk of stimulant seizures recorded in Europe relate to amphetamine, except for those in Hungary and perhaps some in Ukraine, which may relate to methamphetamine.

126. As mentioned above, the United States continues to record some amphetamine laboratory detections, but the number has decreased in recent years and the drug remains insignificant as compared to methamphetamine availability in the country. In this context, it must be noted, however, that statistics on seizures of amphetamine-type stimulants often do not differentiate between the various types. Mexico reported a relatively large seizure of amphetamine in 1999 (568 kg), in addition to the country's interceptions of methamphetamine during that year. Yet the amphetamine seizure was reportedly due to only one single case, which originated in Germany and was destined for the United States.<sup>31</sup> Despite this relatively large seizure case, there is currently no other indication of a rising trend of amphetamine trafficking from Europe to the Americas.

127. Amphetamine is also not of significant concern in south-east Asia. The only country that continues to report on amphetamine production is Australia. As with methamphetamine, most of the amphetamine available in Australia is domestically produced.

Amphetamine abuse has been associated with polydrug use, and the drug is commonly injected.<sup>32</sup>

### **Ecstasy-type substances**

128. Trafficking and abuse of Ecstasy-type substances<sup>33</sup> has been increasing rapidly in several regions. Ecstasy is, however, more exposed to international trafficking than other amphetamine-type stimulants. Seizure statistics for 1999 reflected particularly large rises in several countries throughout the world (see figures 40 and 49).

129. The manufacture of Ecstasy-type substances continues to be concentrated in western Europe, which supplies expanding consumer markets in many parts of the world, including North America and south-east Asia. Belgium, Germany, the Netherlands, the United Kingdom and, to a lesser extent, France and Spain all reported the detection of clandestine laboratories manufacturing Ecstasy-type substances in recent years. In 1999, the Netherlands reported the detection of 24 Ecstasy laboratories, Belgium 4 and Germany and the United Kingdom one each. Unlike in the case of amphetamines, the production of Ecstasy-type substances does not seem to have spread to eastern Europe to such a great extent. Only Ukraine reported the discovery of Ecstasy laboratories in recent years. In this context, Ukraine appears to have emerged as a production site for synthetic drugs, with seven methamphetamine and three Ecstasy laboratories being discovered over recent years. The country also recorded some seizures of Ecstasy in 1999 (see figure 46).

130. A rising trend was also reflected in seizure statistics for Europe in 1999, though a higher peak was noted in earlier years (see figure 49). The United Kingdom recorded a very large seizure volume of Ecstasy-type substances in 1999, signifying an enormous increase over previous years. Large seizure quantities in 1999 and increases over previous years have also been reported in Belgium, France, Germany, Ireland and the Netherlands (see figure 50).

131. Manufacture of Ecstasy-type substances in North America remains relatively limited, though abuse of the drug is spreading fast throughout the region. Detection of clandestine laboratories in the United States has occurred to a limited extent in recent years, but in 1999 the number of discoveries increased to 14. A similar trend was noted in Canada. The number of

Ecstasy laboratories seized in Canada was between one and three in recent years, but increased to eight in 1999 (see figure 36). Though Ecstasy seems to be increasingly manufactured in North America, Europe remains the primary source of that type of drug, which continues to be trafficked to many parts of the world, including North America. In the United States, it has been estimated that 80 per cent of Ecstasy-type substances consumed worldwide originate from clandestine laboratories in the Netherlands and Belgium.<sup>34</sup>

132. The increase in the trafficking of Ecstasy to North America is also reflected in seizure statistics. Annual seizure data reported by Canada and the United States reflected an enormous rise in recent years. Particularly large increases were noted in 1999 (see figure 40) and reports for 2000 on customs seizures in the United States reflect further increases.<sup>34</sup>

133. Ecstasy-type substances have also spread to east and south-east Asia. Australia continues to be the main destination of illicit traffic of methylenedioxymethylamphetamine (MDMA), originating from western Europe. Other countries in the region, too, have noted the emergence and increase in trafficking of that drug type, with Ecstasy seizures being made in, for example, China (Hong Kong SAR), Indonesia, Malaysia, Singapore and Thailand. According to reports from Australia, the origin of MDMA continues to be Belgium, the Netherlands and the United Kingdom.<sup>35</sup> To a limited extent, Ecstasy is also produced within the region, mainly in Australia and Indonesia. During 1998-1999, five MDMA laboratories were found in Australia. Indonesia, which is known as a trans-shipment point for trafficking of Ecstasy-type substances, reported the detection of one MDMA/methylenedioxyamphetamine (MDA) laboratory in 1999. The country also reported a relatively large stimulant seizure totalling 219 kg.

134. Finally, Ecstasy also continues to be trafficked in other regions of the world. Israel recorded a relatively large Ecstasy seizure in 1999. Some Ecstasy was also seized in Brazil and South Africa during that year.

### **Other synthetic drugs**

135. The significance of lysergic acid diethylamide (LSD) for illegal drug markets in North America and western Europe seems to have declined in recent years. Most countries in both regions, as well as Argentina,

## Main countries of manufacture and seizure trends in Europe

Figure 45

Amphetamine laboratory detections reported by countries in Europe, 1994-1999

<sup>a</sup>The Netherlands additionally reported a number of laboratory detections of manufacture of various amphetamine-type stimulants, such as amphetamine and Ecstasy.

Figure 46

Ecstasy laboratory detections reported by countries in Europe, 1997-1999

<sup>a</sup>The Netherlands additionally reported a number of laboratory detections of manufacture of various amphetamine-type stimulants, such as amphetamine and Ecstasy.

<sup>b</sup>Ukraine additionally reported the detection of seven methamphetamine laboratories.

Figure 47

Stimulant (mainly amphetamine) seizures in Europe and trends in the highest ranking country, 1986-1999

Figure 48

Stimulant (mainly amphetamine) seizures in Europe, 1998-1999 (average): ranking of countries

(In tons)

<sup>a</sup> Relates mainly to methamphetamine.

Figure 49

**Hallucinogen (including Ecstasy) seizures in Europe and trends in the highest ranking country, 1986-1999**

Australia, Hungary, Indonesia, Israel, Japan, Poland, New Zealand and South Africa, recorded LSD seizures in 1999, but a falling trend has been noted in many countries. However, the United States recorded a relatively large seizure total of 65 kg in 1999.

136. A decreasing trend has also been noted in methaqualone trafficking in recent years. Seizures are declining in India, the main source country in the past. A total of 470 kg was intercepted in 1999, the lowest level since the early 1980s. However, consumption in South Africa, the main market for the drug, remains high. Seizure of methaqualone in South Africa amounted to 625 kg in 1999, which is the average level for the decade, but is higher than recent years. Production of methaqualone is assumed to take place within the African region. Other countries in southern Africa, including Namibia and Zambia, recorded methaqualone seizures in 1999, but the quantities intercepted were relatively low. Methaqualone is basically not available in other regions, except, to a very limited extent, in North America. Canada recorded 56 kg and the United States an equivalent of 8 kg of methaqualone seized in 1999.

137. Since many countries continue to report the Ecstasy-type substances in the hallucinogen group, statistics on other hallucinogens are difficult to analyse.

Figure 50

**Hallucinogen (including Ecstasy) seizures in Europe in 1999: ranking of countries**

(In tons)

However, in 1999, Thailand recorded large quantities of hallucinogen seizures other than Ecstasy. Additionally, Kazakhstan reported very large hallucinogen seizures for 1999.

138. Turkey continues to record seizures of captagon (fenetylamine), and for the first time in 1999 reported the detection of a laboratory for illicit captagon manufacture, though its manufacturing capacity or whether it was used for tableting purposes remained unknown. Slovenia also reported the discovery of a fenetylamine laboratory during the same year.

## IX. Reports of the subsidiary bodies of the Commission

139. Three meetings of the Commission's subsidiary bodies were held in 2000. The thirty-fifth session of the Subcommittee on Illicit Drug Traffic and Related Matters in the Near and Middle East was held in Antalya, Turkey, from 26 to 30 June 2000; the Tenth Meeting of Heads of National Drug Law Enforcement Agencies (HONLEA), Latin America and the Caribbean, was held in Ottawa from 3 to 6 October 2000; and the Twenty-fourth Meeting of Heads of National Drug Law Enforcement Agencies,

Asia and the Pacific, was held in Yangon from 14 to 17 November 2000.

140. Each meeting, following a review of drug trafficking trends and regional and subregional cooperation, addressed drug law enforcement issues of priority concern for the region. Consideration of these issues was facilitated by the discussions that took place during informal meetings of working groups established for that purpose. In addition, it is the practice of subsidiary bodies to review the implementation of previous recommendations on a biennial basis, with the exception of HONLEA, Europe, which is convened on a triennial basis.

141. The thirty-fifth session of the Subcommission on Illicit Drug Traffic and Related Matters in the Near and Middle East considered the following issues: practical measures taken by law enforcement agencies to mobilize community support for anti-drug objectives; measures to eliminate or reduce corrupt practice on the part of law enforcement personnel; and emerging trends in illicit drug traffic, including smuggling through the mail and express services and the diversion of precursors, and measures to prevent them. The Tenth Meeting of Heads of National Drug Law Enforcement Agencies, Latin America and the Caribbean, examined the role of law enforcement in demand reduction; trends in the manufacture, trafficking, and distribution of amphetamine-type stimulants and action to counter their abuse; and precursor control measures and trends. The Twenty-fourth Meeting of Heads of National Drug Law Enforcement Agencies, Asia and the Pacific, examined illicit traffic in, and consumption of, heroin; the impact of electronic crime on drug trafficking strategy; control of stimulants; and illicit traffic by sea.

142. The recommendations of the subsidiary bodies are to be implemented at the national level by the law enforcement agencies attending the meetings. The salient points covered in those recommendations are summarized for the attention of the Commission below. The full texts are contained in the reports of the meetings (UNDCP/SUBCOM/2000/6, UNDCP/HONLAC/2000/4 and UNDCP/HONLAP/2000/5).

## **A. Recommendations of the subsidiary bodies**

### **1. Demand reduction**

143. The principles of drug demand reduction should be included in the curricula of law enforcement training institutions and in the training provided to prosecutors and judges. Law enforcement agencies should identify ways to increase their level of participation in demand reduction activities and build stronger links with other organizations and sectors working in the area. They should also evaluate their demand reduction activities to ensure the most effective use of their resources, while exploring opportunities to secure additional resources from both the Government and the private sector. Governments should implement comprehensive drug demand reduction strategies, including law enforcement agencies, using the resources of all relevant ministries and involving high-profile activities, such as special sports events. Furthermore, Governments should direct more financial resources towards research into the physical, mental and social costs of abuse of illicit drugs.

### **2. Amphetamine-type stimulants and their precursors**

144. Governments should give priority to implementing the measures to prevent the illicit manufacture, import, export, trafficking, distribution and diversion of precursors used in the illicit manufacture of narcotic drugs and psychotropic substances adopted by the General Assembly at its twentieth special session (resolution S-20/4 B of 10 June 1998, sect. I), the relevant provisions of the United Nations Convention against Illicit Traffic in Narcotic Drugs and Psychotropic Substances of 1988<sup>36</sup> and, where applicable, the recommendations contained in the Lucknow Accord on the Adoption of Uniform Measures to Control International Trade in Precursors and Other Chemicals Used in the Illicit Manufacture of Narcotic Drugs and Psychotropic Substances adopted by the Economic and Social Council in its resolution 1999/31 of 28 July 1999. Governments should assess the requirements of national industries for precursors, in particular potassium permanganate and acetic anhydride, and other selected chemicals, to determine the quantities required for legitimate uses. The provisions of paragraph 10 of article 12 of the

1988 Convention, applicable to substances in table I of the 1988 Convention, should be extended on a voluntary basis to potassium permanganate and acetic anhydride. Furthermore, in view of the health and safety risks associated with dismantling laboratories for the manufacture of synthetic drugs, research and training aimed at reducing the risk to law enforcement officers should be supported.

145. Law enforcement agencies should identify emerging trends in the illicit manufacture and trafficking of amphetamine-type stimulants, sharing the information with other countries and with the International Narcotics Control Board. Governments should make full use of the existing multilateral chemical reporting form to ensure rapid processing of pre-export notifications from other competent authorities. Closer working relationships should be forged with the competent authorities in other countries to target the sources of supply and improve the control over amphetamine-type stimulants and their chemical precursors. Cross-border cooperation to stop trafficking in precursor chemicals to methamphetamine production areas should be improved, with continued support from UNDCP, and Governments should locate clandestine laboratories with a view to dismantling their operations.

### **3. Illicit traffic in and consumption of heroin**

146. Governments should introduce legislation, sound administrative procedures and comprehensive training of law enforcement agencies in the identification, control and movement of precursor chemicals essential for the manufacture of heroin. Furthermore, countries should work to lower barriers to full cooperation through cross-border, bilateral and multilateral agreements with neighbouring States and regional counterparts; enhanced information exchange to strengthen the development of strategic and operational intelligence; and the posting of drug enforcement liaison officers to facilitate investigations and conclude successful prosecutions against those who traffic in heroin. Governments should also strengthen their banking laws with effective anti-money-laundering legislation.

### **4. Alternative development**

147. Where applicable, Governments should actively encourage rural communities engaged in illicit crop

cultivation to discontinue the practice in return for the benefits associated with alternative development programmes. Law enforcement authorities should continue to play a critical role in the implementation of such programmes and in ensuring that agreed eradication targets are met, as well as in preventing the renewed cultivation of illicit crops in areas where eradication has already taken place. Furthermore, international donors and Governments should continue to support UNDCP alternative development projects.

### **5. Anti-corruption measures**

148. There should be procedures in place to properly investigate reports of corrupt practices by drug law enforcement personnel and to guarantee a high level of integrity. Furthermore, there should be procedures to protect any officer reporting on such corrupt practices. Governments should also adopt a code of conduct applicable to high-ranking officials in sensitive positions, such as in police and customs services, to ensure a high level of integrity. Integrity programmes should be adopted to address corruption by those holding public office, drawing on the work of the United Nations and other international organizations. Measures to reduce corrupt practice on the part of drug law enforcement personnel include salary programmes to ensure adequate remuneration, making the involvement of law enforcement personnel in drug trafficking an aggravated criminal offence, holding officials accountable for their actions and establishing a monitoring mechanism.

### **6. Trafficking by mail**

149. Drug law enforcement agencies should adopt measures to screen outbound international mail in order to intercept, investigate and deter consignments of illicit drugs before they are exported. Law enforcement agencies should develop systematic targeting and profiling procedures to identify couriers and concealed consignments. They should also enter into agreements with postal companies to identify illicit drug consignments.

### **7. Electronic crime and drug trafficking**

150. With regard to electronic crime, Governments should develop national policies supporting law enforcement responses. Law enforcement agencies should liaise with Internet service providers concerning

the retention of relevant data and combating money-laundering via the Internet.

## 8. Trafficking by sea

151. Countries should develop specialist strategies and proactive approaches against maritime trafficking, including a maritime intelligence capacity to monitor vessel movements, as well as sharing such information with other Governments.

## B. Other matters brought to the attention of the Commission

152. The attention of the Commission was drawn to the offer of the Government of Australia to host the Twenty-fifth Meeting of Heads of National Drug Law Enforcement Agencies, Asia and the Pacific, on a date to be determined by UNDCP and the Government of Australia.
